ARM can write to this register anytime. However, if the write occurs at the same time that the Timer is being reset by a reception in the first Mailbox, then the write value is discarded.

Reading this register affects the Mailbox Unlocking procedure. For additional details, refer to [Message Buffer Lock Mechanism](#).

27.8.4 Rx Mailboxes Global Mask Register (FLEXCANx_RXMGMASK)

RXMGMASK is provided for legacy support. Asserting the MCR[IRMQ] bit causes the RXMGMASK Register to have no effect on the module operation.

RXMGMASK is used to mask the filter fields of all Rx MBs, excluding MBs 14-15, which have individual mask registers.

This register can only be written in Freeze mode as it is blocked by hardware in other modes.

Table 27-19. Rx Mailboxes Global Mask usage

SMB[RTR] ¹	CTRL2[RRS]	CTRL2[EACEN]	Mailbox filter fields			
			MB[RTR]	MB[IDE]	MB[ID]	reserved
0	-	0	- Note ²	- Note ³	MG[28:0]	MG[31:29]
0	-	1	MG[31]	MG[30]	MG[28:0]	MG[29]
1	0	-	-	-	-	MG[31:0]
1	1	0	-	-	MG[28:0]	MG[31:29]
1	1	1	MG[31]	MG[30]	MG[28:0]	MG[29]

1. RTR bit of the Incoming Frame. It is saved into an auxiliary MB called Rx Serial Message Buffer (Rx SMB).
2. If CTRL2[EACEN] bit is negated the RTR bit of Mailbox is never compared with the RTR bit of the Incoming Frame (Rx SMB[RTR]).
3. If CTRL2[EACEN] bit is negated the IDE bit of Mailbox is always compared with the IDE bit of the Incoming Frame (Rx SMB[IDE]).

27.8.7 Error Counter Register (FLEXCANx_ECR)

This register has 2 8-bit fields reflecting the value of two FLEXCAN error counters: Transmit Error Counter (Tx_Err_Counter field) and Receive Error Counter (Rx_Err_Counter field). The rules for increasing and decreasing these counters are described in the CAN protocol and are completely implemented in the FLEXCAN module. Both counters are read only except in Freeze Mode, where they can be written by the ARM.

FLEXCAN responds to any bus state as described in the protocol, e.g. transmit 'Error Active' or 'Error Passive' flag, delay its transmission start time ('Error Passive') and avoid any influence on the bus when in 'Bus Off' state. The following are the basic rules for FLEXCAN bus state transitions.

- If the value of Tx_Err_Counter or Rx_Err_Counter increases to be greater than or equal to 128, the FLT_CONF field in the Error and Status Register is updated to reflect 'Error Passive' state.
- If the FLEXCAN state is 'Error Passive', and either Tx_Err_Counter or Rx_Err_Counter decrements to a value less than or equal to 127 while the other already satisfies this condition, the FLT_CONF field in the Error and Status Register is updated to reflect 'Error Active' state.
- If the value of Tx_Err_Counter increases to be greater than 255, the FLT_CONF field in the Error and Status Register is updated to reflect 'Bus Off' state, and an interrupt may be issued. The value of Tx_Err_Counter is then reset to zero.
- If FLEXCAN is in 'Bus Off' state, then Tx_Err_Counter is cascaded together with another internal counter to count the 128th occurrences of 11 consecutive recessive bits on the bus. Hence, Tx_Err_Counter is reset to zero and counts in a manner where the internal counter counts 11 such bits and then wraps around while incrementing the Tx_Err_Counter. When Tx_Err_Counter reaches the value of 128, the FLT_CONF field in the Error and Status Register is updated to be 'Error Active' and both error counters are reset to zero. At any instance of dominant bit following a stream of less than 11 consecutive recessive bits, the internal counter resets itself to zero without affecting the Tx_Err_Counter value.
- If during system start-up, only one node is operating, then its Tx_Err_Counter increases in each message it is trying to transmit, as a result of acknowledge errors (indicated by the ACK_ERR bit in the Error and Status Register). After the transition to 'Error Passive' state, the Tx_Err_Counter does not increment anymore by acknowledge errors. Therefore the device never goes to the 'Bus Off' state.
- If the Rx_Err_Counter increases to a value greater than 127, it is not incremented further, even if more errors are detected while being a receiver. At the next

successful message reception, the counter is set to a value between 119 and 127 to resume to 'Error Active' state.

27.8.8 Error and Status 1 Register (FLEXCANx_ESR1)

This register reflects various error conditions, some general status of the device and it is the source of four interrupts to the ARM.

The ARM read action clears bits 15-10, therefore the reported *error conditions*(bits 15-10) are those that occurred since the last time the ARM read this register. Bits 9-3 are status bits .

Some bits in this register are read-only and some are not .

FLEXCANx_ESR1 field descriptions

Field	Description
31–19 -	This field is reserved. Reserved
18 SYNCH	This read-only flag indicates whether the FlexCAN is synchronized to the CAN bus and able to participate in the communication process. It is set and cleared by the FlexCAN. Refer to Table 27-20 1 FlexCAN is synchronized to the CAN bus 0 FlexCAN is not synchronized to the CAN bus
17 TWRN_INT	If the WRN_EN bit in MCR is asserted, the TWRN_INT bit is set when the TX_WRN flag transition from '0' to '1', meaning that the Tx error counter reached 96. If the corresponding mask bit in the Control Register (TWRN_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This flag is not generated during "Bus Off" state. This bit is not updated during Freeze mode. 1 The Tx error counter transition from < 96 to >= 96 0 No such occurrence

Table continues on the next page...

FLEXCANx_ESR1 field descriptions (continued)

Field	Description
16 RWRN_INT	<p>If the WRN_EN bit in MCR is asserted, the RWRN_INT bit is set when the RX_WRN flag transition from '0' to '1', meaning that the Rx error counters reached 96. If the corresponding mask bit in the Control Register (RWRN_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This bit is not updated during Freeze mode.</p> <p>1 The Rx error counter transition from < 96 to >= 96 0 No such occurrence</p>
15 BIT1_ERR	<p>This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.</p> <p>This bit is not set by a transmitter in case of arbitration field or ACK slot, or in case of a node sending a passive error flag that detects dominant bits.</p> <p>1 At least one bit sent as recessive is received as dominant 0 No such occurrence</p>
14 BIT0_ERR	<p>This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.</p> <p>1 At least one bit sent as dominant is received as recessive 0 No such occurrence</p>
13 ACK_ERR	<p>This bit indicates that an Acknowledge Error has been detected by the transmitter node, i.e., a dominant bit has not been detected during the ACK SLOT.</p> <p>1 An ACK error occurred since last read of this register 0 No such occurrence</p>
12 CRC_ERR	<p>This bit indicates that a CRC Error has been detected by the receiver node, i.e., the calculated CRC is different from the received.</p> <p>1 A CRC error occurred since last read of this register. 0 No such occurrence</p>
11 FRM_ERR	<p>This bit indicates that a Form Error has been detected by the receiver node, i.e., a fixed-form bit field contains at least one illegal bit.</p> <p>1 A Form Error occurred since last read of this register 0 No such occurrence</p>
10 STF_ERR	<p>This bit indicates that a Stuffing Error has been detected.</p> <p>1 A Stuffing Error occurred since last read of this register. 0 No such occurrence.</p>
9 TX_WRN	<p>This bit indicates when repetitive errors are occurring during message transmission.</p> <p>1 TX_Err_Counter \geq 96 0 No such occurrence</p>
8 RX_WRN	<p>This bit indicates when repetitive errors are occurring during message reception.</p> <p>1 Rx_Err_Counter \geq 96 0 No such occurrence</p>
7 IDLE	<p>This bit indicates when CAN bus is in IDLE state. Refer to Table 27-20.</p>

Table continues on the next page...

FLEXCANx_ESR1 field descriptions (continued)

Field	Description
	<p>1 CAN bus is now IDLE 0 No such occurrence</p>
6 TX	<p>This bit indicates if FLEXCAN is transmitting a message. Refer to Table 27-20.</p> <p>1 FLEXCAN is transmitting a message 0 FLEXCAN is receiving a message</p>
5-4 FLT_CONF	<p>If the LOM bit in the Control Register is asserted, after some delay that depends on the CAN bit timing the FLT_CONF field will indicate "Error Passive". The very same delay affects the way how FLT_CONF reflects an update to ECR register by the ARM. It may be necessary up to one CAN bit time to get them coherent again.</p> <p>Since the Control Register is not affected by soft reset, the FLT_CONF field will not be affected by soft reset if the LOM bit is asserted.</p> <p>This 2-bit field indicates the Confinement State of the FLEXCAN module, as shown in below:</p> <p>00 Error Active 01 Error Passive 1x Bus off</p>
3 RX	<p>This bit indicates if FlexCAN is receiving a message. Refer to Table 27-20.</p> <p>1 FLEXCAN is transmitting a message 0 FLEXCAN is receiving a message</p>
2 BOFF_INT	<p>This bit is set when FLEXCAN enters 'Bus Off' state. If the corresponding mask bit in the Control Register (BOFF_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. Writing '0' has no effect.</p> <p>1 FLEXCAN module entered 'Bus Off' state 0 No such occurrence</p>
1 ERR_INT	<p>This bit indicates that at least one of the Error Bits (bits 15-10) is set. If the corresponding mask bit in the Control Register (ERR_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. Writing '0' has no effect.</p> <p>1 Indicates setting of any Error Bit in the Error and Status Register 0 No such occurrence</p>
0 WAK_INT	<p>When FLEXCAN is Stop Mode and a recessive to dominant transition is detected on the CAN bus and if the WAK_MSK bit in the MCR Register is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When SLF_WAK is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the SLF_WAK is set again. Writing '0' has no effect</p> <p>1 Indicates a recessive to dominant transition received on the CAN bus when the FLEXCAN module is in Stop Mode 0 No such occurrence</p>

27.8.9 Interrupt Masks 2 Register (FLEXCANx_IMASK2)

This register allows any number of a range of 32 Message Buffer Interrupts to be enabled or disabled. It contains one interrupt mask bit per buffer, enabling the ARM to determine which buffer generates an interrupt after a successful transmission or reception (i.e. when the corresponding IFLAG2 bit is set).

Address: Base address + 24h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

FLEXCANx_IMASK1 field descriptions

Field	Description
BUF31M_BUF0M	<p>Each bit enables or disables the respective FLEXCAN Message Buffer (MB0 to MB31) Interrupt.</p> <p>Setting or clearing a bit in the IMASK1 Register can assert or negate an interrupt request, if the corresponding IFLAG1 bit is set</p>

FLEXCANx_IMASK1 field descriptions (continued)

Field	Description
1	The corresponding buffer Interrupt is enabled
0	The corresponding buffer Interrupt is disabled

27.8.11 Interrupt Flags 2 Register (FLEXCANx_IFLAG2)

This register defines the flags for 32 Message Buffer interrupts. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG2 bit. If the corresponding IMASK2 bit is set, an interrupt will be generated. The interrupt flag must be cleared by writing it to '1'. Writing '0' has no effect. Before updating MCR[MAXMB] field, ARM must treat the IFLAG2 bits which MB value is greater than the MCR[MAXMB] to be updated, otherwise they will keep set and be inconsistent with the amount of MBs available.

Address: Base address + 2Ch offset

FLEXCANx_IFLAG2 field descriptions

Field	Description
BUF63I_BUF32I	Each bit flags the respective FLEXCAN Message Buffer (MB32 to MB63) interrupt.
1	The corresponding buffer has successfully completed transmission or reception
0	No such occurrence

27.8.12 Interrupt Flags 1 Register (FLEXCANx_IFLAG1)

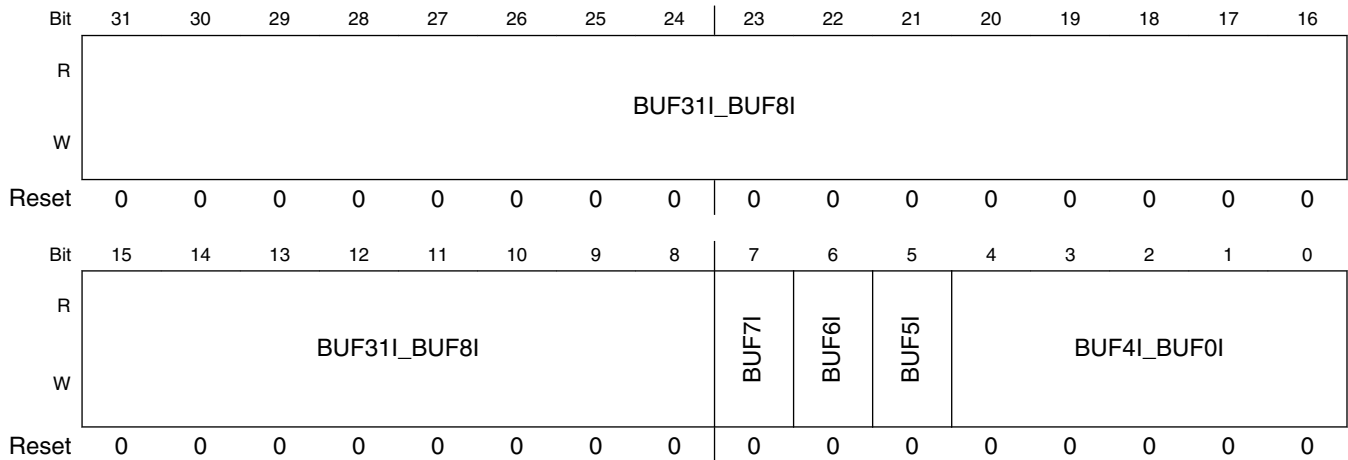

This register defines the flags for 32 Message Buffer interrupts and FIFO interrupts. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG1 bit. If the corresponding IMASK1 bit is set, an interrupt will be generated. The Interrupt flag must be cleared by writing it to '1'. Writing '0' has no effect.

When the RFEN bit in the MCR is set (Rx FIFO enabled), the function of the 8 least significant interrupt flags (BUF7I - BUF0I) is changed to support the FIFO operation. BUF7I, BUF6I and BUF5I indicate operating conditions of the FIFO, while BUF4I to BUF0I are not used. Before enabling the RFEN, ARM must service the IFLAG1 asserted

in the Rx FIFO region (see [Rx FIFO](#)). Otherwise, these IFLAGS will mistakenly show the related MBs now belonging to FIFO as having contents to be serviced. When the RFEN is negated, the FIFO flags must be cleared. The same care must be taken when a RFFN value is selected extending Rx FIFO filters beyond MB7 (see [Control 2 Register \(FLEXCAN_CTRL2\)](#)). For example, when RFFN is 0x8, the MB0-23 range is occupied by Rx FIFO filters and related IFLAGS must be cleared.

Before updating MCR[MAXMB] field, ARM must service the IFLAG1 which MB value is greater than the MCR[MAXMB] to be updated, otherwise they will keep set and be inconsistent with the amount of MBs available.

Address: Base address + 30h offset

FLEXCANx_IFLAG1 field descriptions

Field	Description
31–8 BUF31I_BUF8I	Each bit flags the respective FLEXCAN Message Buffer (MB8 to MB31) interrupt. 1 The corresponding MB has successfully completed transmission or reception 0 No such occurrence
7 BUF7I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB7. If the MCR[RFEN] bit is asserted, this flag indicates that a message was lost because Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. 1 MB7 completed transmission/reception or FIFO overflow 0 No such occurrence
6 BUF6I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB6. If the MCR[RFEN] bit is asserted, this flag indicates when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. Note that if the flag is cleared while the number of unread messages is greater than 4 it will not assert again until the number of unread messages within the Rx FIFO is decreased to equal or less than 4. This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes.

Table continues on the next page...

FLEXCANx_IFLAG1 field descriptions (continued)

Field	Description
	1 MB6 completed transmission/reception or FIFO almost full 0 No such occurrence
5 BUF5I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB5. If the Rx FIFO is enabled, this flag indicates that at least one frame is available to be read from the Rx FIFO. This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. 1 MB5 completed transmission/reception or frames available in the FIFO 0 No such occurrence
BUF4I_BUF0I	If the Rx FIFO is not enabled, these bits flag the interrupts for MB0 to MB4 . If the Rx FIFO is enabled, these flags are not used and must be considered as reserved locations. These flags are cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. 1 Corresponding MB completed transmission/reception 0 No such occurrence

27.8.13 Control 2 Register (FLEXCANx_CTRL2)

This register contains control bits for CAN errors, FIFO features and mode selection.

Table 27-21. Rx FIFO Filters

1. The number of the last remaining available mailboxes is defined by the MCR[MAXMB] field.
2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.

Each group of eight filters occupies a memory space equivalent to two Message Buffers which means that the more filters are implemented the less Mailboxes will be available.

Considering that the Rx FIFO occupies the memory space originally reserved for MB0-5, RFFN should be programmed with a value corresponding to a number of filters not greater than the number of available memory words which can be calculated as follows:

$$(\text{SETUP_MB} - 6) \times 4$$

where SETUP_MB is MAXMB.

The number of remaining Mailboxes available will be:

$$\text{SETUP_MB} - 8 - (\text{RFFN} \times 2)$$

If the Number of Rx FIFO Filters programmed through RFFN exceeds the SETUP_MB value, the exceeding ones will not be functional. Unshaded regions in [Table 27-22](#) indicate the valid combinations of MAXMB, RFEN and RFFN, shaded regions are not functional.

Field	Description
31 -	must be written as 0
30-29 -	This field is reserved. Reserved

Table continues on the next page...

FLEXCANx_CTRL2 field descriptions (continued)

Field	Description
28 WRMFRZ	<p>Enable unrestricted write access to FlexCAN memory in Freeze mode. This bit can only be written in Freeze mode and has no effect out of Freeze mode.</p> <p>1 Enable unrestricted write access to FlexCAN memory 0 Keep the write access restricted in some regions of FlexCAN memory</p>
27–24 RFFN	<p>This 4-bit field defines the number of Rx FIFO filters according to Table 27-21 . The maximum selectable number of filters is determined by the ARM. This field can only be written in Freeze mode as it is blocked by hardware in other modes. RFFN defines a number of Message Buffers occupied by Rx FIFO and ID Filter (see Table 27-21) that may not exceed the number of available Mailboxes present in module, defined by MCR[MAXMB]. Default RFFN value is 0x0, which leads to a total of 8 Rx FIFO filters, occupies the first 8 Message Buffers (MB 0-7) and makes available the next Message Buffers (MB 8-63) for Mailboxes. As a second example, when RFFN is set to 0xD, there will be 112 Rx FIFO filters, located in MB 0-33, and MB 34-63 are available for Mailboxes. Notice that, in this case, individual masks (RXIMR) will just cover Rx FIFO filters in 0-31 range, and filters 32-111 will use RXFGMASK. In case of reducing the number of last Message Buffers, MCR[MAXMB] (see Module Configuration Register (FLEXCAN_MCR)) can be adjusted by the application to minimum of 33, in order to give room to the Rx FIFO and its ID Filter Table defined by RFFN. On the contrary, if the application sets MCR[MAXMB] to 16, for instance, the maximum RFFN is limited to 0x4. RFFN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table 27-18 (see Arbitration and Matching Timing).</p>
23–19 TASD	<p>This 5-bit field indicates how many CAN bits the Tx arbitration process start point can be delayed from the first bit of CRC field on CAN bus. This field can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>This field is useful to optimize the transmit performance based on factors such as: peripheral/serial clock ratio, CAN bit timing and number of MBs . The duration of an arbitration process, in terms of CAN bits, is directly proportional to the number of available MBs and CAN baud rate and inversely proportional to the peripheral clock frequency.</p> <p>The optimal arbitration timing is that in which the last MB is scanned right before the first bit of the Intermission field of a CAN frame. Therefore, if there are few MBs and the system/serial clock ratio is high and the CAN baud rate is low then the arbitration can be delayed and vice-versa.</p> <p>If TASD is 0 then the arbitration start is not delayed, thus ARM has less time to configure a Tx MB for the next arbitration, but more time is reserved for arbitration . In the other hand, if TASD is 24 then ARM can configure a Tx MB later and less time is reserved for arbitration.</p> <p>If too little time is reserved for arbitration the FlexCAN may be not able to find winner MBs in time to compete with other nodes for the CAN bus. If the arbitration ends too much time before the first bit of Intermission field then there is a chance that ARM reconfigure some Tx MBs and the winner MB is not the best to be transmitted.</p> <p>The reset value is different on various platforms, according to their peripheral clock frequency, number of MBs and target CAN baud rate.</p> <p>The optimal configuration for TASD can be calculated as:</p>

Table continues on the next page...

FLEXCANx_CTRL2 field descriptions (continued)

Field	Description
	$TASD = 25 - \left\{ \frac{f_{CANCLK} \times [MAXMB + 3 - (RFEN \times 8) - (RFEN \times RFFN \times 2)] \times 2}{f_{SYS} \times [1 + (PSEG1 + 1) + (PSEG2 + 1) + (PROPSEG + 1)] \times (PRES DIV + 1)} \right\}$ <p>where:</p> <p>f_{CANCLK} is the Protocol Engine (PE) Clock in Hz; PE clock is derived from CAN_CLK_ROOT in CCM. See the Clock controller module.</p> <p>f_{SYS} is the peripheral clock in Hz;</p> <p>MAXMB is the value in CTRL1[MAXMB] field;</p> <p>RFEN is the value in CTRL1[RFEN] bit;</p> <p>RFFN is the value in CTRL2[RFFN] field;</p> <p>PSEG1 is the value in CTRL1[PSEG1] field;</p> <p>PSEG2 is the value in CTRL1[PSEG2] field;</p> <p>PROPSEG is the value in CTRL1[PROPSEG] field;</p> <p>PRES DIV is the value in CTRL1[PRES DIV] field.</p> <p>Please refer to Arbitration process and Protocol Timing for more details.</p>
<p>18 MRP</p>	<p>If this bit is set the matching process starts from the Mailboxes and if no match occurs the matching continues on the Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Matching starts from Mailboxes and continues on Rx FIFO 0 Matching starts from Rx FIFO and continues on Mailboxes</p>
<p>17 RRS</p>	<p>If this bit is asserted Remote Request Frame is submitted to a matching process and stored in the corresponding Message Buffer in the same fashion of a Data Frame. No automatic Remote Response Frame will be generated.</p> <p>If this bit is negated the Remote Request Frame is submitted to a matching process and an automatic Remote Response Frame is generated if a Message Buffer with CODE=0b1010 is found with the same ID.</p> <p>This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Remote Request Frame is stored 0 Remote Response Frame is generated</p>
<p>16 EACEN</p>	<p>This bit controls the comparison of IDE and RTR bits within Rx Mailboxes filters with their corresponding bits in the incoming frame by the matching process. This bit does not affect matching for Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Enables the comparison of both Rx Mailbox filter's IDE and RTR bit with their corresponding bits within the incoming frame. Mask bits do apply. 0 Rx Mailbox filter's IDE bit is always compared and RTR is never compared despite mask bits.</p>
<p>-</p>	<p>This field is reserved.</p>

Table continues on the next page...

FLEXCANx_CTRL2 field descriptions (continued)

Field	Description
	Reserved

27.8.14 Error and Status 2 Register (FLEXCANx_ESR2)

This register reflects various interrupt flags and some general status.

Address: Base address + 38h offset

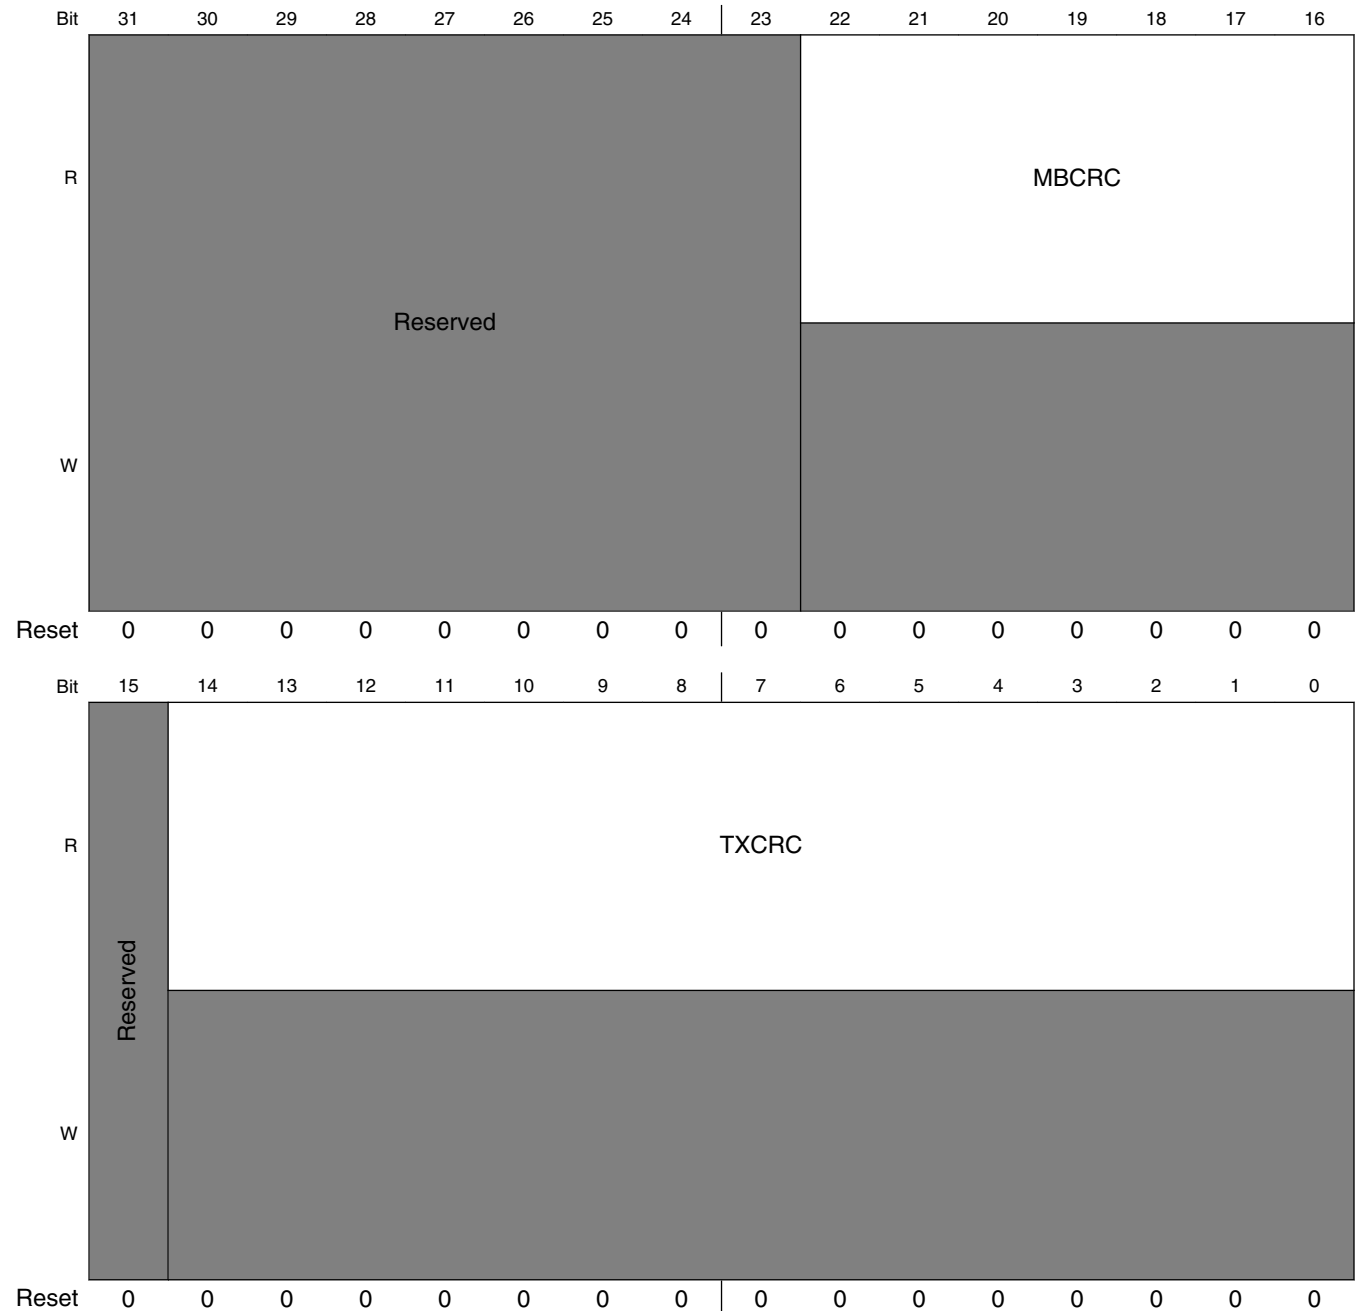

FLEXCANx_ESR2 field descriptions

Field	Description
31–23 -	This field is reserved. Reserved
22–16 LPTM	If ESR2[VPS] is asserted, this 7-bit field indicates the lowest number inactive Mailbox (refer to IMB bit description). If there is no inactive Mailbox then the Mailbox indicated depends on CTRL1[LBUF] bit value . If CTRL1[LBUF] bit is negated then the Mailbox indicated is the one which has the greatest arbitration value (see Highest Mailbox priority first). If CTRL1[LBUF] bit is asserted then the Mailbox indicated is the highest number active Tx Mailbox. If a Tx Mailbox is being transmitted it is not considered in LPTM calculation. If ESR2[IMB] is not asserted and a frame is transmitted successfully, LPTM is updated with its Mailbox number.
15 -	This field is reserved. Reserved
14 VPS	This bit indicates whether IMB and LPTM contents are currently valid or not. VPS is asserted upon every complete Tx arbitration process unless the ARM writes to Control and Status word of a Mailbox that has already been scanned (i.e. it is behind Tx Arbitration Pointer) during the Tx arbitration process . If there is no inactive Mailbox and only one Tx Mailbox which is being transmitted then VPS is not asserted. VPS is negated upon the start of every Tx arbitration process or upon a write to Control and Status word of any Mailbox. ESR2[VPS] is not affected by any ARM write into Control Status (C/S) of a MB which is blocked by abort mechanism. When MCR[AEN] is asserted, the abort code write in C/S of a MB that is been transmitted (pending abort), or any write attempt into a Tx MB with IFLAG set is blocked. 1 Contents of IMB and LPTM are valid 0 Contents of IMB and LPTM are invalid
13 IMB	If ESR2[VPS] is asserted, this bit indicates whether there is any inactive Mailbox (CODE field is either 0b1000 or 0b0000). This bit is asserted in the following cases: (1) During arbitration, if a LPTM is found and it is inactive. (2) If IMB is not asserted and a frame is transmitted successfully. (3) This bit is cleared in all start of arbitration (see Arbitration process). LPTM mechanism have the following behavior: if a MB is successfully transmitted and ESR2[IMB]=0 (no inactive Mailbox), then ESR2[VPS] and ESR2[IMB] are asserted and the index related to the MB just transmitted is loaded into ESR2[LPTM]. 1 If ESR2[VPS] is asserted, there is at least one inactive Mailbox. LPTM content is the number of the first one. 0 If ESR2[VPS] is asserted, the ESR2[LPTM] is not an inactive Mailbox.
-	This field is reserved. Reserved

27.8.15 CRC Register (FLEXCANx_CRCR)

This register provides information about the CRC of transmitted messages

Address: Base address + 44h offset

FLEXCANx_CRCCR field descriptions

Field	Description
31–23 -	This field is reserved. Reserved
22–16 MBCRC	This field indicates the number of the Mailbox corresponding to the value in TXCRC field.
15 -	This field is reserved. Reserved
TXCRC	This field indicates the CRC value of the last message transmitted. This field is updated at the same time the Tx Interrupt Flag is asserted.

27.8.16 Rx FIFO Global Mask Register (FLEXCANx_RXFGMASK)

If Rx FIFO is enabled RXFGMASK is used to mask the Rx FIFO ID Filter Table elements that do not have a corresponding RXIMR according to CTRL2[RFFN] field setting.

This register can only be written in Freeze Mode as it is blocked by hardware in other modes.

Table 27-23. Rx FIFO Global Mask usage

Rx FIFO ID Filter Table Elements Format (MCR[IDAM])	Identifier Acceptance Filter fields					
	RTR	IDE	RXIDA	RXIDB	RXIDC	reserved
A	FGM[31]	FGM[30]	FGM[29:1]	-	-	FGM[0]
B	FGM[31] FGM[15]	FGM[30] FGM[14]	-	FGM[29:16] FGM[13:0] 1	-	-
C	-	-	-	-	FGM[31:24] FGM[23:16] FGM[15:8] FGM[7:0] 2	-

1. If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
2. If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.

FLEXCAN Memory Map/Register Definition

Address: Base address + 48h offset

FLEXCANx_RXFGMASK field descriptions

Field	Description
FGM31_FGM0	<p>These bits mask the ID Filter Table elements bits in a perfect alignment. Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK) shows in detail which FGM bits mask each IDAF field. Clear this register has the effect of disabling the ID Filter.</p> <p>1 The corresponding bit in the filter is checked 0 The corresponding bit in the filter is "don't care"</p>

27.8.17 Rx FIFO Information Register (FLEXCANx_RXFIR)

RXFIR provides information on Rx FIFO.

This register is the port through which ARM accesses the output of the RXFIR FIFO located in RAM. The RXFIR FIFO is written by the FlexCAN whenever a new message is moved into the Rx FIFO as well as its output is updated whenever the output of the Rx FIFO is updated with the next message. Refer to [Rx FIFO](#) to find instructions on reading this register.

Address: Base address + 4Ch offset

FLEXCANx_RXFIR field descriptions

Field	Description
31–9 -	This field is reserved. Reserved
IDHIT	This 9-bit field indicates which Identifier Acceptance Filter (see Rx FIFO Structure) was hit by the received message that is in the output of the Rx FIFO . (refer to Rx FIFO for details) If multiple filters match the incoming message ID then the first matching IDAF found (lowest number) by the matching process is indicated. This field is valid only while the IFLAG[BUF5I] is asserted.

27.8.18 Rx Individual Mask Registers (FLEXCANx_RXIMRn)

RXIMR are used as acceptance masks for ID filtering in Rx MBs and the Rx FIFO . If the Rx FIFO is not enabled, one mask register is provided for each available Mailbox, providing ID masking capability on a per Mailbox basis.

When the Rx FIFO is enabled (MCR[RFEN] bit is asserted), up to 32 Rx Individual Mask Registers can apply to the Rx FIFO ID Filter Table elements on a one-to-one correspondence depending on CTRL2[RFFN] setting. Refer to [Control 2 Register \(FLEXCAN_CTRL2\)](#) for details .

RXIMR can only be written by the ARM while the module is in Freeze Mode, otherwise they are blocked by hardware .

The Individual Rx Mask Registers are not affected by reset and must be explicitly initialized prior to any reception.

Address: Base address + 880h offset + (4d × i), where i=0d to 63d

FLEXCANx_RXIMRn field descriptions

Field	Description
MI31_MIO	<p>These bits mask both Mailbox filter and Rx FIFO ID Filter Table element in distinct ways.</p> <p>For Mailbox filter refer to Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK).</p> <p>For Rx FIFO ID Filter Table element refer to Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK).</p> <p>1 The corresponding bit in the filter is checked 0 the corresponding bit in the filter is "don't care"</p>

27.8.19 Glitch Filter Width Registers (FLEXCANx_GFWR)

The Glitch Filter just takes effects when FLEXCAN enters the STOP mode.

Address: Base address + 9E0h offset

FLEXCANx_GFWR field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
GFWR	<p>It determines the Glitch Filter Width. The width will be divided from Oscillator clock by GFWR values. By default, it is 5.33 μs when the oscillator is 24 MHz.</p> <p>Filter Pulse Width = [(GFWR FIELD + 1) x (1 / Osc. Frequency)]</p>

Chapter 28

General Power Controller (GPC)

28.1 Overview

The General Power Control (GPC) block includes the sub-blocks listed here.

- [DVFS - Dynamic Voltage & Frequency Scaling](#) load tracking for CPU
- [CPU Power Gating Control \(PGC\)](#)

Each sub-block has its own IP registers.

GPC determines wake-up irq for exiting STOP mode (with or without CPU power gating).

Figure 28-1. GPC Block Diagram

28.2 Clocks

The table found here describes the clock sources for GPC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 28-1. GPC Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
pgc_clk	ipg_clk_root	PGC peripheral clock
sys_clk	ipg_clk_root	Module clock

28.3 DVFS overview

The DVFS allows simple dynamic voltage frequency scaling.

The frequency of the core clock domain and the voltage of the core power domain can be changed on the fly while all modules (including the MCU) continue their normal operation. The frequency of the core clock domain can be changed by temporarily switching to an alternate PLL clock, or by changing the post dividers division factors.

The DVFS load tracking block allows hardware tracking on the core load and generate an interrupt when a frequency change is requested.

NOTE

DVFS is a monitor that only provides an interrupt when CPU load exceeds the predefined value and does not send any request to make a change of voltage and frequency. This can be done by the user in the CPU interrupt routine or SDMA routine.

Figure 28-2. DVFS_core diagram

28.3.1 Features

The DVFS load tracking block includes the following features:

- Configurable include/exclude of input signals:
 - per-core ARM standby signal (idle / non-idle)
 - 16 general purpose bits (common for all 4 tracking modules)
 - Configurable weight to each bit.
- Configurable generated clocks and averaging time slicing (respond time).
- Configurable panic mode respond logic (for frequency up).
- Programmable buffer for last 4, 8, 12, or 16 load tracking samples of core 0 (only).

28.4 DVFS output event/interrupt configuration

Event/interrupt will be always high as long as LBFL is '1' and is not cleared by SW. Unless DVFEV (always event) is asserted. Then the event/interrupt will be toggled up and down at every toggle of div_3_clk.

28.4.1 Interrupts

DVFS generates an interrupt that indicates that frequency and voltage update is needed. The user has to read the FSVAIM bits in order to know which change needs to be done.

28.4.2 DVFS Change Request Sequence Diagrams

The following figures describe the sequence on DVFS interrupt.

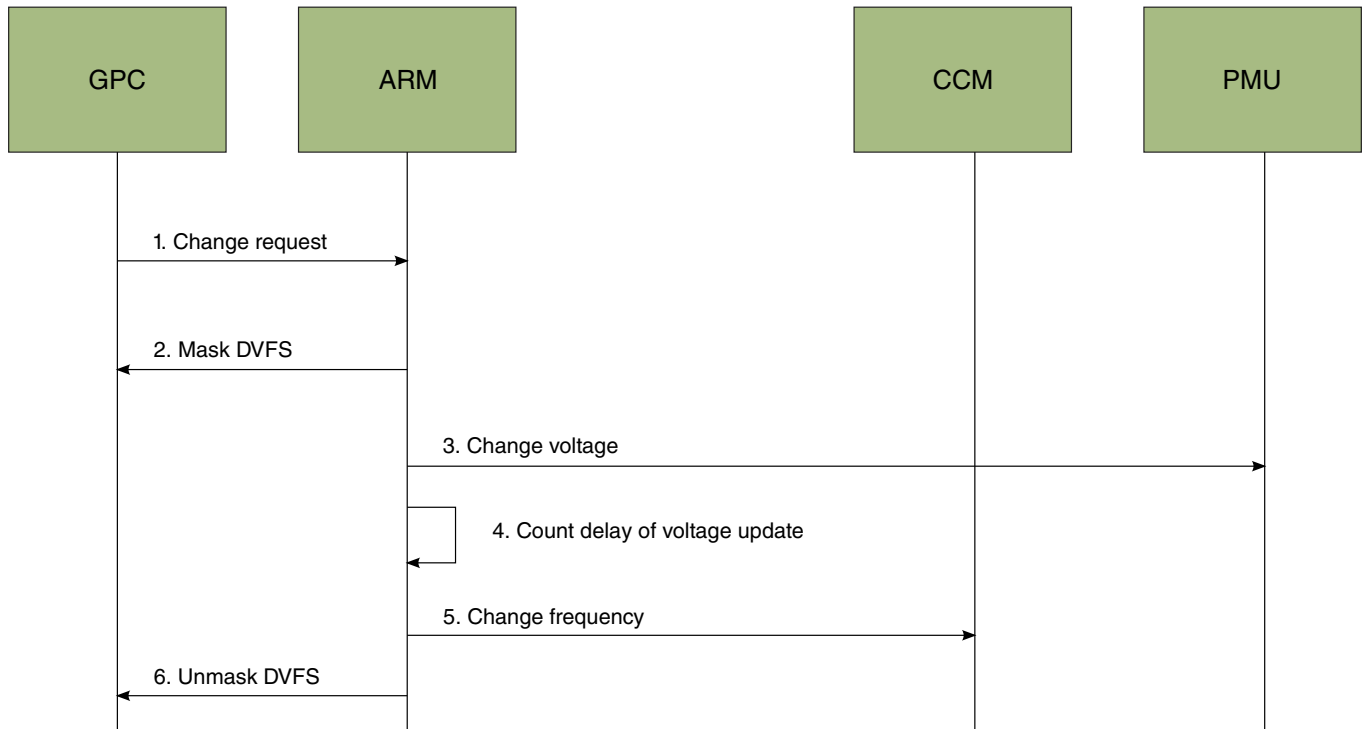

Figure 28-3. DVFS - frequency increase

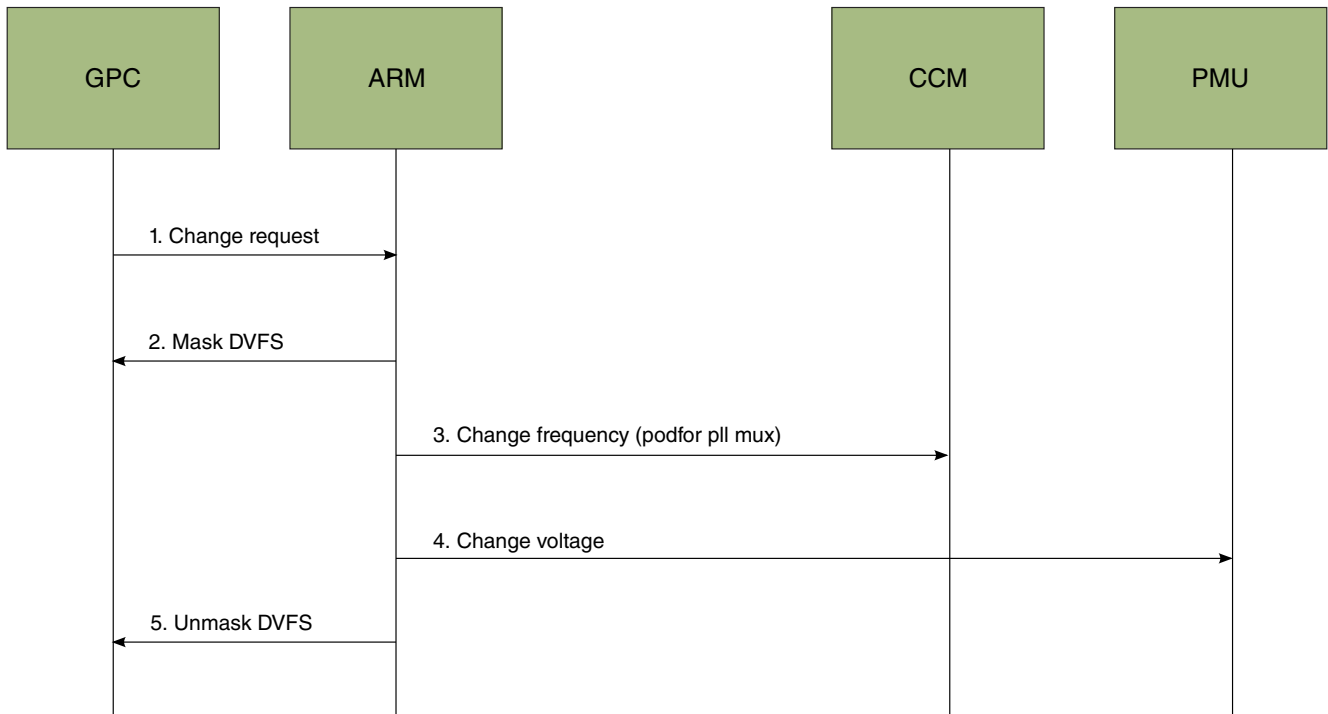

Figure 28-4. DVFS - frequency decrease

CPU DVFS frequency change can be performed in 2 ways:

- PLL inputs muxing update
- clock dividers update

28.5 Power Gating Control (PGC)

Power Gating (PGC) is applied to the ARM CPU only in STOP low power mode, after all essential CPU registers data are saved by ARM dormant procedure.

If any of the unmasked interrupts appears, CPU is powered up and clock restore request (exit from STOP mode) is sent to CCM.

PGC power down sequence:

- CCM sends power down request when the chip is about to enter stop mode. The user should define which modules will be powered down (PGCR registers of corresponding PGC module, bit 0).

PGC power up sequence:

- One of the power up irq is asserted.

- Power up request is asserted in GPC and in CCM.
- The Power Gated modules are powered up, according to PGC settings of appropriate module.

The Power Gated modules require reset after powering up. The next figure describes GPC-SRC handshake procedure for reset after power gating.

Figure 28-5. GPC-SRC handshake for reset after power gating

28.5.1 Overview

The Power Gating Controller (PGC) is a power management component that controls the power-down and power-up sequencing of individual subsystems.

The sequence timing is programmable using the PGC control registers. [Figure 28-6](#) shows PGC as part of the SoC's overall power management scheme.

Figure 28-6. PGC Block Diagram

28.5.1.1 Features

Key features of the PGC include:

- Provides the ability to switch off power to a target subsystem.
- Generates power-up and power-down control sequences.
- Provides programmable registers to adjust the timing of the power control signals.

28.6 GPC Interrupt Controller (INTC)

The INTC (Interrupt Controller) detects an interrupt and generates the wakeup signal. It supports up to 128 interrupts.

28.6.1 Interrupt Controller features

The features of the GPC INTC are listed below.

Features:

- Supports up to 128 interrupts
- Provides an option to mask/unmask each interrupt
- Detects interrupts and generates the wake up signal
- 32-bits IP bus interface
- All registers are byte-accessible

28.7 GPC Memory Map/Register Definition

Detailed descriptions of each register can be found below.

GPC memory map

ISR2 Register - status of irq [95:64].

Address: 20D_C000h base + 1Ch offset = 20D_C01Ch

GPC_ISR2 field descriptions

Field	Description
ISR2	IRQ[95:64] status, read only

28.7.9 IRQ status resister 3 (GPC_ISR3)

ISR3 Register - status of irq [127:96].

Address: 20D_C000h base + 20h offset = 20D_C020h

GPC_ISR3 field descriptions

Field	Description
ISR3	IRQ[127:96] status, read only

28.7.10 IRQ status resister 4 (GPC_ISR4)

ISR4 Register - status of irq [159:128].

Address: 20D_C000h base + 24h offset = 20D_C024h

GPC_ISR4 field descriptions

Field	Description
ISR4	IRQ[159:128] status, read only

28.8 PGC Memory Map/Register Definition

The PGC registers can be accessed only in supervisor mode.

Attempts to access registers when not in supervisor mode or attempts to access an unimplemented address location might trigger a bus transfer error. (The hardware asserts the signal `ips_xfr_err` if the PGC has been integrated with `resp_sel` tied low.) In this case, software should take appropriate action (such as ignore the error, log the error, or initiate a soft reset).

All PGC registers are byte-accessible.

NOTE

The base address of each PGC module instantiation is specified in the GPC module. Absolute address values will be calculated by `[GPC base address] + [PGC CPU/GPU/DISPLAY Offset]`.

PGC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
220	PGC Mega Control Register (PGC_MEGA_CTRL)	32	R/W	0000_0000h	28.8.1/1299
224	PGC Mega Power Up Sequence Control Register (PGC_MEGA_PUPSCR)	32	R/W	0000_0F01h	28.8.2/1299
228	PGC Mega Pull Down Sequence Control Register (PGC_MEGA_PDNSCR)	32	R/W	0000_0101h	28.8.3/1300

PGC_MEGA_PUPSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SW2ISO	After asserting power toggle on/off signal (switch_b), the PGC waits a number of IPG clocks equal to the value of SW2ISO before negating isolation. NOTE: SW2ISO must not be programmed to zero.
7–6 Reserved	This read-only field is reserved and always has the value 0.
SW	After a power-up request (pup_req assertion), the PGC waits a number of IPG clocks equal to the value of SW before asserting power toggle on/off signal (switch_b). NOTE: SW must not be programmed to zero. NOTE: The PGC clock is generated from the IPG_CLK_ROOT. for frequency configuration of the IPG_CLK_ROOT. See Clock Controller Module (CCM) .

28.8.3 PGC Mega Pull Down Sequence Control Register (PGC_MEGA_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: 0h base + 228h offset = 228h

PGC_MEGA_PDNSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 ISO2SW	After asserting isolation, the PGC waits a number of IPG clocks equal to the value of ISO2SW before negating power toggle on/off signal (switch_b). NOTE: ISO2SW must not be programmed to zero.
7–6 Reserved	This read-only field is reserved and always has the value 0.
ISO	After a power-down request (pdn_req assertion), the PGC waits a number of IPG clocks equal to the value of ISO before asserting isolation. NOTE: ISO must not be programmed to zero.

28.8.4 PGC Mega Power Gating Controller Status Register (PGC_MEGA_SR)

The SR contains the status parameters.

Address: 0h base + 22Ch offset = 22Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

DVFS Memory Map/Register Definition

DVFS_CNTR field descriptions

Field	Description
31-29 DIV3CK	DIV3CK - div_3_clk division ratio inside the DVFS module. According to the Table 28-2
28 DVFEV	Always give a DVFS event. 0 Do not give an event always. 1 Always give event.
27 LBMI	Load buffer full mask interrupt. This bit masks the generation of this interrupt. Load buffer full interrupt is masked (LBFL0 and LBFL1 bits still will be updated, but interrupt won't be generated) Load buffer full interrupt is enabled.
26 LBFL1	Load buffer 1 - full status bit. This bit indicates that log buffer registers are full. The bit is set to 1 automatically. An interrupt will be generated if LBMI bit is set to "0" Write '1' to clear. (write '0' leaves bit unchanged) 1 Load buffer0 is full. 0 Load buffer0 is not full.
25 LBFL0	Load buffer 0 - full status bit. This bit indicates that log buffer registers are full. The bit is set to 1 automatically. An interrupt will be generated if LBMI bit is set to "0" Write '1' to clear. (write '0' leaves bit unchanged) 1 Load buffer1 is full. 0 Load buffer1 is not full.
24 DVFIS	DVFS Interrupt select. These bits define destination of DVFS interrupts. 1 MCU interrupt will be generated for DVFS events. 0 SDMA interrupt will be generated for DVFS events.
23 PIRQS	PIRQS - Pattern IRQ Source * write '1' to clear. Writing '1' will clear interrupt if interrupt was from pattern 1 DVFS IRQ source was from pattern 0 DVFS IRQ source was not from pattern

Field	Description
22 FSVAIM	DVFS Frequency adjustment interrupt mask. This bit masks the DVFS frequency adjustment interrupt. FSVAI status bits will be still asserted in relevant cases. 1 interrupt is masked. 0 interrupt is enabled.
21–20 FSVAI[1:0]	FSVAI DVFS Frequency adjustment interrupt. These status bits indicate that the system frequency should be changed. 00 no interrupt 01 frequency should be increased. Low priority interrupt. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MAXF = 1 (highest frequency). 10 frequency should be decreased. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MINF= 1 (lowest frequency). 11 frequency should be increased immediately. High priority interrupt. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MAXF = 1 (highest frequency).
19 Reserved	This read-only field is reserved and always has the value 0.
18 MAXF	Maximum frequency reached. Interrupt will not be created in maximum frequency reached and frequency increase required. 1 max frequency reached 0 max frequency not reached
17 MINF	Minimum frequency reached. Interrupt will not be created in minimum frequency reached and frequency decrease required. 1 min frequency reached 0 min frequency not reached
16–11 DIV_RATIO	DIV_RATIO - Divider value. Divider divides the input ARM clock, following the table Table 28-3
10 Reserved	This read-only field is reserved and always has the value 0.
9 PFUE	PFUE - Period Frequency Update Enable 1 enabled 0 disabled
8–6 PFUS	PFUS - Periodic Frequency Update Status 000 no update 100 DVFSPT0 period, previous finished(can be performance level decrease) 101 DVFSPT1 period, previous finished(can be EMA-detected performance level) 110 DVFSPT2 period, previous finished(can be performance level increase) 111 DVFSPT3 period, previous finished (can be EMA-detected performance level)
5 LTBRSH	LTBRSH - Load Tracking Buffer Register Shift: 0 values of [5:2] of the selected input are saving in Load Tracking Buffer 1 values of [4:1] of the selected input are saving in Load Tracking Buffer
4–3 LTBRSR	LTBRSR - Load Tracking Buffer Register Source:

Chapter 29

General Purpose Input/Output (GPIO)

29.1 Overview

The GPIO general-purpose input/output peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs.

When configured as an output, it is possible to write to an internal register to control the state driven on the output pin. When configured as an input, it is possible to detect the state of the input by reading the state of an internal register. In addition, the GPIO peripheral can produce CORE interrupts.

The GPIO is one of the blocks controlling the IOMUX of the chip.

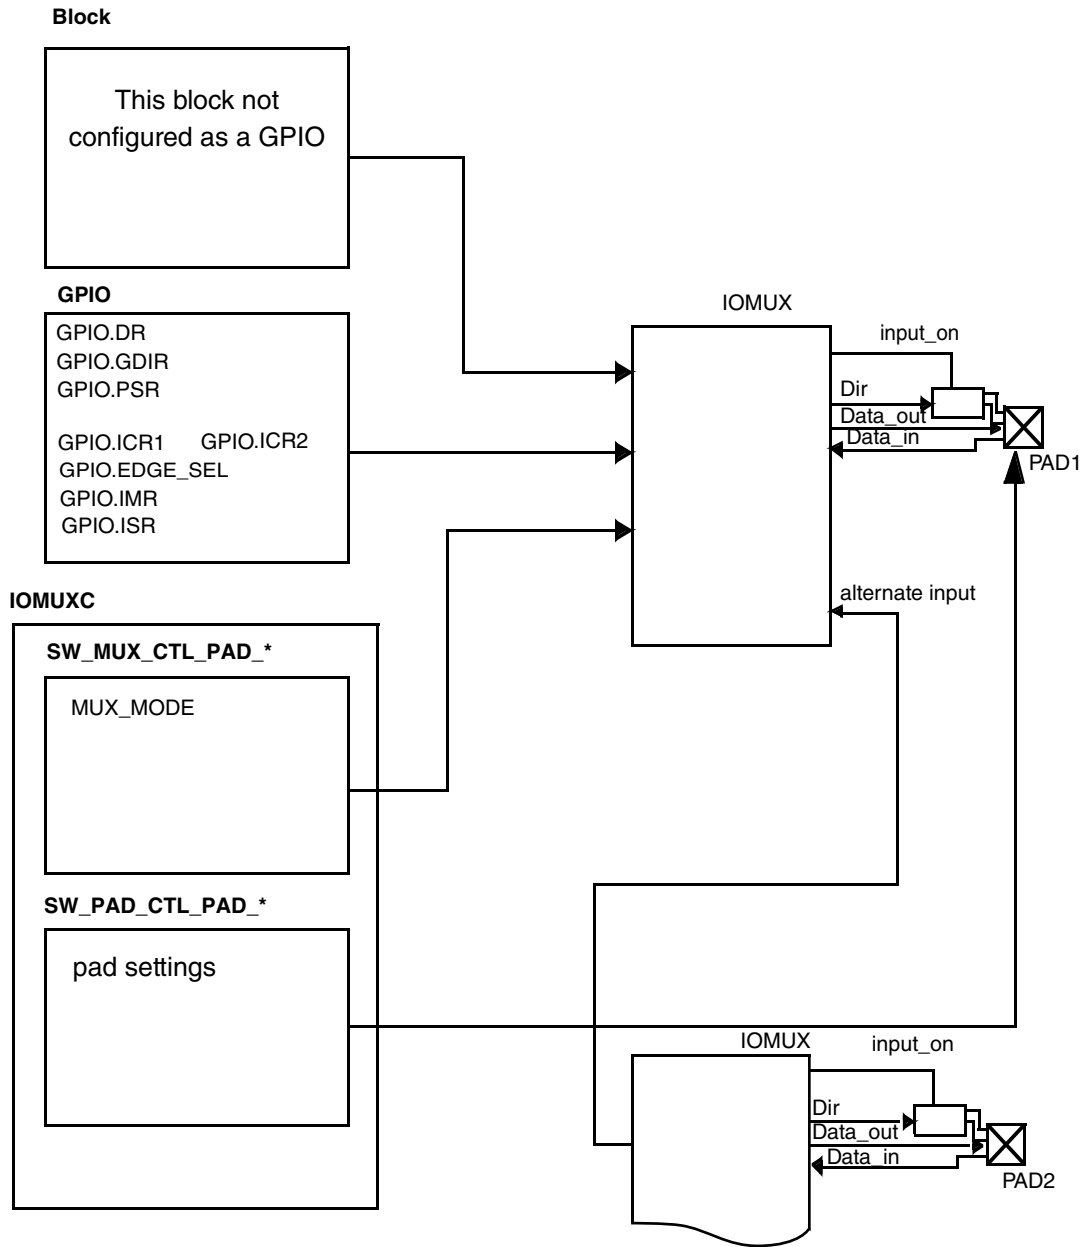

Figure 29-1. Chip IOMUX Scheme

The GPIO functionality is provided through eight registers, an edge-detect circuit, and interrupt generation logic.

The eight registers are:

- Data register (GPIO_DR)
- GPIO direction register (GPIO_GDIR)
- Pad sample register (GPIO_PSR)
- Interrupt control registers (GPIO_ICR1, GPIO_ICR2)

- Edge select register (GPIO_EDGE_SEL)
- Interrupt mask register (GPIO_IMR)
- Interrupt status register (GPIO_ISR)

These registers are described in detail in [GPIO Memory Map/Register Definition](#).

Each GPIO input has a dedicated edge-detect circuit which can be configured through software to detect rising edges, falling edges, logic low-levels or logic high-levels on the input signals. The outputs of the edge detect circuits are optionally masked by setting the corresponding bit in the interrupt mask register (GPIO_IMR). These qualified outputs are OR'ed together to generate two one-bit interrupt lines:

- Combined interrupt indication for GPIOx signals 0 - 15
- Combined interrupt indication for GPIOx signals 16 - 31

In addition, GPIO1 provides visibility to each of its 8 low order interrupt sources (i.e. GPIO1 interrupt n, for n = 0 – 7). However, individual interrupt indications from other GPIOx are not available.

The GPIO edge detection is described further in [Interrupt Control Unit](#).

The GPIO's overall functionality is described further in [GPIO Functional Description](#).

29.1.1 Block Diagram

The GPIO subsystem contains 8 GPIO blocks which can generate and control up to 32 signals for general purpose.

A block diagram of the GPIO is shown in [Figure 29-2](#)

Figure 29-2. GPIO Block Diagram

29.1.2 Features

The GPIO includes the following features:

- General purpose input/output logic capabilities:
 - Drives specific data to output using the data register (GPIO_DR)
 - Controls the direction of the signal using the GPIO direction register (GPIO_GDIR)
 - Enables the core to sample the status of the corresponding inputs by reading the pad sample register (GPIO_PSR).
- GPIO interrupt capabilities:
 - Supports up to 32 interrupts
 - Identifies interrupt edges
 - Generates three active-high interrupts to the SoC interrupt controller

29.2 External Signals

The tables found here describe the external signals of GPIO.

Table 29-1. GPIO External Signals

29.3 Clocks

The table found here describes the clock sources for GPIO.

Please see the clock controller Module for clock setting, configuration and gating information.

Table 29-2. GPIO Clocks

Clock name	Clock Root	Description
ipg_clk_s	ipg_clk_root	Peripheral access clock

29.4 GPIO Functional Description

This section provides a complete functional description of the block.

29.4.1 GPIO Function

A GPIO signal can operate as a general-purpose input/output when the IOMUX is set to GPIO mode. Each GPIO signal may be independently configured as either an input or an output using the GPIO direction register (GPIO_GDIR).

When configured as an output (GPIO_GDIR bit = 1), the value in the data bit in the GPIO data register (GPIO_DR) is driven on the corresponding GPIO line. When a signal is configured as an input (GPIO_GDIR bit = 0), the state of the input can be read from the corresponding GPIO_PSR bit.

29.4.2 GPIO pad structure

Figure 29-3. GPIO pad functional diagram

29.4.2.1 Input Driver

Input driver characteristics

- Selectable Schmitt trigger or CMOS input mode
- Keeper structure with buffer at the input receiver output to Core
- Receiver is tri-stated when I/O supply (OVDD) is powered down. (Keeper at receiver output keeps its previous state).

29.4.2.1.1 Schmitt trigger

The anti-jamming functionality of the Schmitt trigger is illustrated below.

Figure 29-4. Schmitt trigger transfer characteristic

Figure 29-5. Receiver output in CMOS and hysteresis

29.4.2.1.2 Input keeper

A simple latch to hold the input value when OVDD is powered down, or the first inverter is tri-stated. Input buffer's keeper is always enabled for all the pads.

29.4.2.2 Output Driver

Output driver characteristics

- Selectable CMOS or open-drain output type
- Selectable pull-keeper enable signal to enable/disable the pull-up/down and output keeper
- Selectable pull-up resistors of 22K, 47K, 100K and a pull-down resistor of 100KOhm. Unsilicided P+ poly resistor is used to limit resistance variation to within +/- 20%.
- Pull-up, pull-down, and pad keeper are disabled in output mode.
- Seven drive strengths in each operating mode
- Additional 2-bit slew rate control to select between 50, 100, and 200 MHz IO cell operation range with reduced switching noise

Figure 29-6. Output Driver Functional Diagram

29.4.2.2.1 Drive strength

Drive strength selection can be use to make the impedance matched and get better signal integrity.

29.4.2.2.2 Output keeper

A simple latch to hold the input value.

Figure 29-7. Keeper functional diagram

29.4.2.2.3 PU / PD / Keeper Logic

When Keeper is enabled, the pull-up and pull-down are disabled, and the output value of the pad depends on the Keeper. The output keeper is powered by OVDD. When the core VDD is powered down or the first inverter is tri-stated, the pad's state can be kept. Keeper and Pull can't be enabled together.

29.4.2.2.4 Open drain

Open drain is a circuit technique which allows multiple devices to communication over a single wire bi-directionally. Open drain drivers usually operate with an external or internal pull-up resistor that holds the signal line high until a device sinks enough current to pull the line low, usually used for a bus with multiple devices.

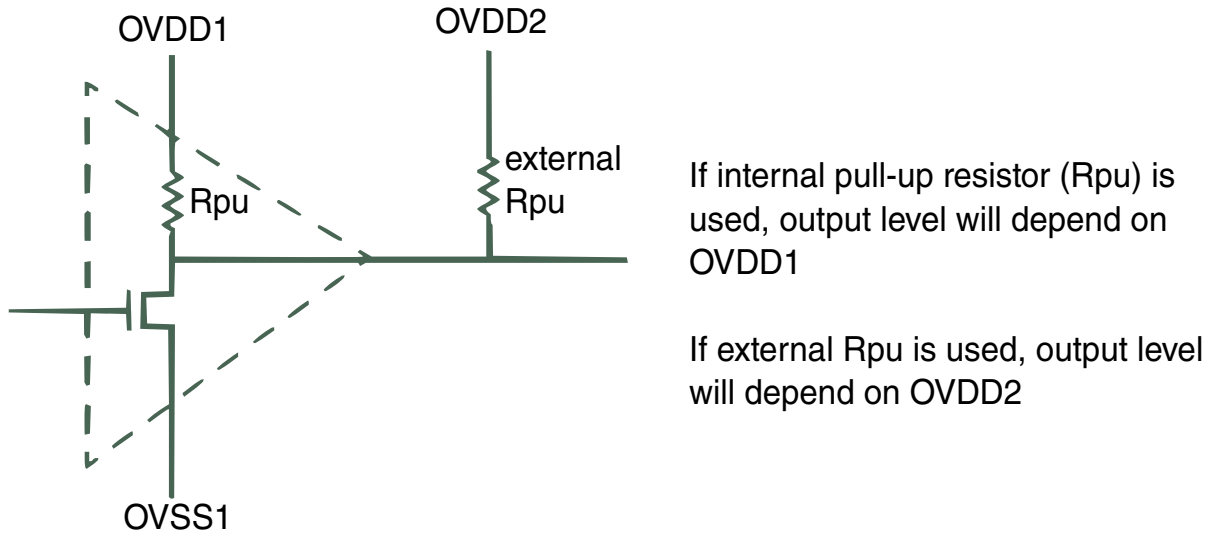

Figure 29-8. Output buffer in open drain mode

29.4.3 GPIO Programming

29.4.3.1 GPIO Read Mode

The programming sequence for reading input signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUX Controller (IOMUXC)).
2. Configure GPIO direction register to input (GPIO_GDIR[GDIR] set to 0b).
3. Read value from data register/pad status register.

A pseudocode description to read [input3:input0] values is as follows:

```
// SET INPUTS TO GPIO MODE.
write sw_mux_ctl_<input0>_<input1>_<input2>_<input3>, 32'h00000000
// SET GDIR TO INPUT.
write GDIR[31:4,input3_bit, input2_bit, input1_bit, input0_bit,] 32'hxxxxxxx0
// READ INPUT VALUE FROM DR.
read DR
// READ INPUT VALUE FROM PSR.
read PSR
```

NOTE

While the GPIO direction is set to input (GPIO_GDIR = 0), a read access to GPIO_DR does not return GPIO_DR data. Instead, it returns the GPIO_PSR data, which is the corresponding input signal value.

29.4.3.2 GPIO Write Mode

The programming sequence for driving output signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUXC), also enable SION if need to read loopback pad value through PSR
2. Configure GPIO direction register to output (GPIO_GDIR[GDIR] set to 1b).
3. Write value to data register (GPIO_DR).

A pseudocode description to drive 4'b0101 on [output3:output0] is as follows:

```
// SET PADS TO GPIO MODE VIA IOMUX.
write sw_mux_ctl_pad_<output[0-3]>.mux_mode, <GPIO_MUX_MODE>
// Enable loopback so we can capture pad value into PSR in output mode
write sw_mux_ctl_pad_<output[0-3]>.sion, 1
// SET GDIR=1 TO OUTPUT BITS.
write GDIR[31:4,output3_bit,output2_bit, output1_bit, output0_bit,] 32'hxxxxxxxF
// WRITE OUTPUT VALUE=4'b0101 TO DR.
write DR, 32'hxxxxxxx5
// READ OUTPUT VALUE FROM PSR ONLY.
read_cmp PSR, 32'hxxxxxxx5
```

29.4.4 Interrupt Control Unit

In addition to the general-purpose input/output function, the edge-detect logic in the GPIO peripheral reflects whether a transition has occurred on a given GPIO signal that is configured as an input (GDIR bit = 0). The interrupt control registers (GPIO_ICR1 and GPIO_ICR2) may be used to independently configure the interrupt condition of each input signal (low-to-high transition, high-to-low transition, low, or high). For information about GPIO_ICR1 and GPIO_ICR2 settings, see [GPIO Memory Map/Register Definition](#).

The interrupt control unit is built of 32 interrupt control subunits, where each subunit handles a single interrupt line.

29.5 GPIO Memory Map/Register Definition

There are eight 32-bit GPIO registers. All registers are accessible from the IP interface. Only 32-bit access is supported.

The GPIO memory map is shown in the following table.

GPIO memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
209_C000	GPIO data register (GPIO1_DR)	32	R/W	0000_0000h	29.5.1/1338
209_C004	GPIO direction register (GPIO1_GDIR)	32	R/W	0000_0000h	29.5.2/1339
209_C008	GPIO pad status register (GPIO1_PSR)	32	R	0000_0000h	29.5.3/1339
209_C00C	GPIO interrupt configuration register1 (GPIO1_ICR1)	32	R/W	0000_0000h	29.5.4/1340
209_C010	GPIO interrupt configuration register2 (GPIO1_ICR2)	32	R/W	0000_0000h	29.5.5/1344
209_C014	GPIO interrupt mask register (GPIO1_IMR)	32	R/W	0000_0000h	29.5.6/1347
209_C018	GPIO interrupt status register (GPIO1_ISR)	32	w1c	0000_0000h	29.5.7/1348
209_C01C	GPIO edge select register (GPIO1_EDGE_SEL)	32	R/W	0000_0000h	29.5.8/1349
20A_0000	GPIO data register (GPIO2_DR)	32	R/W	0000_0000h	29.5.1/1338
20A_0004	GPIO direction register (GPIO2_GDIR)	32	R/W	0000_0000h	29.5.2/1339
20A_0008	GPIO pad status register (GPIO2_PSR)	32	R	0000_0000h	29.5.3/1339
20A_000C	GPIO interrupt configuration register1 (GPIO2_ICR1)	32	R/W	0000_0000h	29.5.4/1340
20A_0010	GPIO interrupt configuration register2 (GPIO2_ICR2)	32	R/W	0000_0000h	29.5.5/1344
20A_0014	GPIO interrupt mask register (GPIO2_IMR)	32	R/W	0000_0000h	29.5.6/1347
20A_0018	GPIO interrupt status register (GPIO2_ISR)	32	w1c	0000_0000h	29.5.7/1348
20A_001C	GPIO edge select register (GPIO2_EDGE_SEL)	32	R/W	0000_0000h	29.5.8/1349
20A_4000	GPIO data register (GPIO3_DR)	32	R/W	0000_0000h	29.5.1/1338
20A_4004	GPIO direction register (GPIO3_GDIR)	32	R/W	0000_0000h	29.5.2/1339
20A_4008	GPIO pad status register (GPIO3_PSR)	32	R	0000_0000h	29.5.3/1339
20A_400C	GPIO interrupt configuration register1 (GPIO3_ICR1)	32	R/W	0000_0000h	29.5.4/1340
20A_4010	GPIO interrupt configuration register2 (GPIO3_ICR2)	32	R/W	0000_0000h	29.5.5/1344
20A_4014	GPIO interrupt mask register (GPIO3_IMR)	32	R/W	0000_0000h	29.5.6/1347
20A_4018	GPIO interrupt status register (GPIO3_ISR)	32	w1c	0000_0000h	29.5.7/1348
20A_401C	GPIO edge select register (GPIO3_EDGE_SEL)	32	R/W	0000_0000h	29.5.8/1349
20A_8000	GPIO data register (GPIO4_DR)	32	R/W	0000_0000h	29.5.1/1338
20A_8004	GPIO direction register (GPIO4_GDIR)	32	R/W	0000_0000h	29.5.2/1339
20A_8008	GPIO pad status register (GPIO4_PSR)	32	R	0000_0000h	29.5.3/1339
20A_800C	GPIO interrupt configuration register1 (GPIO4_ICR1)	32	R/W	0000_0000h	29.5.4/1340
20A_8010	GPIO interrupt configuration register2 (GPIO4_ICR2)	32	R/W	0000_0000h	29.5.5/1344
20A_8014	GPIO interrupt mask register (GPIO4_IMR)	32	R/W	0000_0000h	29.5.6/1347
20A_8018	GPIO interrupt status register (GPIO4_ISR)	32	w1c	0000_0000h	29.5.7/1348
20A_801C	GPIO edge select register (GPIO4_EDGE_SEL)	32	R/W	0000_0000h	29.5.8/1349
20A_C000	GPIO data register (GPIO5_DR)	32	R/W	0000_0000h	29.5.1/1338
20A_C004	GPIO direction register (GPIO5_GDIR)	32	R/W	0000_0000h	29.5.2/1339
20A_C008	GPIO pad status register (GPIO5_PSR)	32	R	0000_0000h	29.5.3/1339
20A_C00C	GPIO interrupt configuration register1 (GPIO5_ICR1)	32	R/W	0000_0000h	29.5.4/1340
20A_C010	GPIO interrupt configuration register2 (GPIO5_ICR2)	32	R/W	0000_0000h	29.5.5/1344
20A_C014	GPIO interrupt mask register (GPIO5_IMR)	32	R/W	0000_0000h	29.5.6/1347

Table continues on the next page...

GPIO memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20A_C018	GPIO interrupt status register (GPIO5_ISR)	32	w1c	0000_0000h	29.5.7/1348
20A_C01C	GPIO edge select register (GPIO5_EDGE_SEL)	32	R/W	0000_0000h	29.5.8/1349

29.5.1 GPIO data register (GPIOx_DR)

The 32-bit GPIO_DR register stores data that is ready to be driven to the output lines. If the IOMUXC is in GPIO mode and a given GPIO direction bit is set, then the corresponding DR bit is driven to the output. If a given GPIO direction bit is cleared, then a read of GPIO_DR reflects the value of the corresponding signal. Two wait states are required in read access for synchronization.

The results of a read of a DR bit depends on the IOMUXC input mode settings and the corresponding GDIR bit as follows:

- If GDIR[n] is set and IOMUXC input mode is GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is GPIO, then reading DR[n] returns the corresponding input signal's value.
- If GDIR[n] is set and IOMUXC input mode is not GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is not GPIO, then reading DR[n] always returns zero.

Address: Base address + 0h offset

GPIOx_DR field descriptions

Field	Description
DR	<p>Data bits. This register defines the value of the GPIO output when the signal is configured as an output (GDIR[n]=1). Writes to this register are stored in a register. Reading GPIO_DR returns the value stored in the register if the signal is configured as an output (GDIR[n]=1), or the input signal's value if configured as an input (GDIR[n]=0).</p> <p>NOTE: The I/O multiplexer must be configured to GPIO mode for the GPIO_DR value to connect with the signal. Reading the data register with the input path disabled always returns a zero value.</p>

29.5.2 GPIO direction register (GPIOx_GDIR)

GPIO_GDIR functions as direction control when the IOMUXC is in GPIO mode. Each bit specifies the direction of a one-bit signal. The mapping of each DIR bit to a corresponding SoC signal is determined by the SoC's pin assignment and the IOMUX table. For more details consult the IOMUXC chapter.

Address: Base address + 4h offset

GPIOx_GDIR field descriptions

Field	Description
GDIR	<p>GPIO direction bits. Bit n of this register defines the direction of the GPIO[n] signal.</p> <p>NOTE: GPIO_GDIR affects only the direction of the I/O signal when the corresponding bit in the I/O MUX is configured for GPIO.</p> <p>0 INPUT — GPIO is configured as input.</p> <p>1 OUTPUT — GPIO is configured as output.</p>

29.5.3 GPIO pad status register (GPIOx_PSR)

GPIO_PSR is a read-only register. Each bit stores the value of the corresponding input signal (as configured in the IOMUX). This register is clocked with the ipg_clk_s clock, meaning that the input signal is sampled only when accessing this location. Two wait states are required any time this register is accessed for synchronization.

Address: Base address + 8h offset

GPIOx_PSR field descriptions

Field	Description
PSR	GPIO pad status bits (status bits). Reading GPIO_PSR returns the state of the corresponding input signal.

GPIOx_PSR field descriptions (continued)

Field	Description
	Settings: NOTE: The IOMUXC must be configured to GPIO mode for GPIO_PSR to reflect the state of the corresponding signal.

29.5.4 GPIO interrupt configuration register1 (GPIOx_ICR1)

GPIO_ICR1 contains 16 two-bit fields, where each field specifies the interrupt configuration for a different input signal.

Address: Base address + Ch offset

GPIOx_ICR2 field descriptions (continued)

Field	Description
5–4 ICR18	Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 18. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00 LOW_LEVEL — Interrupt n is low-level sensitive. 01 HIGH_LEVEL — Interrupt n is high-level sensitive. 10 RISING_EDGE — Interrupt n is rising-edge sensitive. 11 FALLING_EDGE — Interrupt n is falling-edge sensitive.
3–2 ICR17	Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 17. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00 LOW_LEVEL — Interrupt n is low-level sensitive. 01 HIGH_LEVEL — Interrupt n is high-level sensitive. 10 RISING_EDGE — Interrupt n is rising-edge sensitive. 11 FALLING_EDGE — Interrupt n is falling-edge sensitive.
ICR16	Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 16. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00 LOW_LEVEL — Interrupt n is low-level sensitive. 01 HIGH_LEVEL — Interrupt n is high-level sensitive. 10 RISING_EDGE — Interrupt n is rising-edge sensitive. 11 FALLING_EDGE — Interrupt n is falling-edge sensitive.

29.5.6 GPIO interrupt mask register (GPIOx_IMR)

GPIO_IMR contains masking bits for each interrupt line.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPIOx_IMR field descriptions

Field	Description
IMR	Interrupt Mask bits. This register is used to enable or disable the interrupt function on each of the 32 GPIO signals.

GPIOx_IMR field descriptions (continued)

Field	Description
	Settings: Bit IMR[n] (n=0...31) controls interrupt n as follows: 0 UNMASKED — Interrupt n is disabled. 1 MASKED — Interrupt n is enabled.

29.5.7 GPIO interrupt status register (GPIOx_ISR)

The GPIO_ISR functions as an interrupt status indicator. Each bit indicates whether an interrupt condition has been met for the corresponding input signal. When an interrupt condition is met (as determined by the corresponding interrupt condition register field), the corresponding bit in this register is set. Two wait states are required in read access for synchronization. One wait state is required for reset.

Address: Base address + 18h offset

GPIOx_ISR field descriptions

Field	Description
ISR	Interrupt status bits - Bit n of this register is asserted (active high) when the active condition (as determined by the corresponding ICR bit) is detected on the GPIO input and is waiting for service. The value of this register is independent of the value in GPIO_IMR. When the active condition has been detected, the corresponding bit remains set until cleared by software. Status flags are cleared by writing a 1 to the corresponding bit position.

29.5.8 GPIO edge select register (GPIOx_EDGE_SEL)

GPIO_EDGE_SEL may be used to override the ICR registers' configuration. If the GPIO_EDGE_SEL bit is set, then a rising edge or falling edge in the corresponding signal generates an interrupt. This register provides backward compatibility. On reset all bits are cleared (ICR is not overridden).

Address: Base address + 1Ch offset

GPIOx_EDGE_SEL field descriptions

Field	Description
GPIO_EDGE_SEL	Edge select. When GPIO_EDGE_SEL[n] is set, the GPIO disregards the ICR[n] setting, and detects any edge on the corresponding input signal.

Chapter 30

General Purpose Media Interface (GPMI)

30.1 Overview

The GPMI controller is a flexible interface to supporting up to four NAND flash chip selects.

- ONFI3.2, DDR Mode, Samsung / Toshiba Toggle NAND protocol compatible.
- Fully configurable address and command behavior, providing support for future devices not yet specified.

The GPMI resides on the APBH. The GPMI also provides an interface to the BCH module to allow direct parity processing.

Registers are clocked on the HCLK domain. The I/O and pin timing are clocked on a dedicated GPMICLK domain. GPMICLK can be set to maximize I/O performance.

The following figure shows a block diagram of the GPMI controller.

Figure 30-1. General-Purpose Media Interface Controller Block Diagram

30.2 External Signals

The table found here describes the external signals of GPMI.

Table 30-1. GPMI External Signals

Signal	Description	Pad	Mode	Direction
NAND_ALE	Address latch enable signal	NAND_ALE	ALT0	O
NAND_CE0_B	Chip enable signal	NAND_CE0_B	ALT0	O
NAND_CE1_B	Chip enable signal	NAND_CE1_B	ALT0	O
NAND_CE2_B	Chip enable signal	CSI_MCLK	ALT2	O
NAND_CE3_B	Chip enable signal	CSI_PIXCLK	ALT2	O
NAND_CLE	Command latch enable signal	NAND_CLE	ALT0	O
NAND_DATA00	Data signal	NAND_DATA00	ALT0	IO
NAND_DATA01	Data signal	NAND_DATA01	ALT0	IO
NAND_DATA02	Data signal	NAND_DATA02	ALT0	IO
NAND_DATA03	Data signal	NAND_DATA03	ALT0	IO
NAND_DATA04	Data signal	NAND_DATA04	ALT0	IO
NAND_DATA05	Data signal	NAND_DATA05	ALT0	IO
NAND_DATA06	Data signal	NAND_DATA06	ALT0	IO
NAND_DATA07	Data signal	NAND_DATA07	ALT0	IO
NAND_DQS	DQS signal	NAND_DQS	ALT0	IO
NAND_READY_B	Ready signal	NAND_READY_B	ALT0	IO
NAND_RE_B	Read enable signal	NAND_RE_B	ALT0	O
NAND_WE_B	Write enable signal	NAND_WE_B	ALT0	O
NAND_WP_B	Wait polarity signal	NAND_WP_B	ALT0	O

30.3 Clocks

The table found here describes the clock sources for GPMI.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 30-2. GPMI Clocks

Clock name	Clock Root	Description
bch_input_apb_clk		BCH to APBH input clock
gpmi_bch_input_bch_clk		BCH input clock
gpmi_bch_input_gpmi_io_clk		GPMI IO input clock
gpmi_input_apb_clk		GPMI to APBH clock

30.4 GPMI NAND Mode

The general-purpose media interface has several features to efficiently support NAND:

- Individual chip select pins and ganged ready/busy pin for up to four NANDs.
- Individual state machine and DMA channel for each chip select.
- Special command modes work with DMA controller to perform all normal NAND functions without CPU intervention.
- Configurable timing based on a dedicated clock allows optimal balance of high NAND performance and low system power.

GPMI and DMA have been designed to handle complex multi-page operations without CPU intervention. The DMA uses a linked descriptor function with branching capability to automatically handle all of the operations needed to read/write multiple pages:

- **Data/Register Read/Write**-The GPMI can be programmed to read or write multiple cycles to the NAND address, command or data registers.
- **Wait for NAND Ready**-The GPMI's Wait-for-Ready mode can monitor the ready/busy signal of a single NAND flash and signal the DMA when the device has become ready. It also has a time-out counter and can indicate to the DMA that a time-out error has occurred. The DMAs can conditionally branch to a different descriptor in the case of an error.
- **Check Status**-The Read-and-Compare mode allows the GPMI to check NAND status against a reference. If an error is found, the GPMI can instruct the DMA to branch to an alternate descriptor, which attempts to fix the problem or asserts a CPU IRQ.

30.4.1 Multiple NAND Support

The GPMI supports up to four NAND chip selects, with ganged ready/busy pins. Since they share a data bus and control lines, the GPMI can only actively communicate with a single NAND at a time. However, all NANDs can concurrently perform internal read, write, or erase operations. With fast NAND flash and software support for concurrent NAND operations, this architecture allows the total throughput to approach the data bus speed, which can be as high as 50 MB/s (8-bit bus running at 50 MHz single clock edge) in asynchronous mode and 200MB/s (8-bit bus running at 100MHz both clock edges) in Source Synchronous mode.

There are two options for controlling the four NAND chip selects via the DMA interface. The first option is the one to one mapping, where the each DMA channel is tied to its own NAND chip select. For example DMA channel 'n' accesses only NAND attached to chip select 'n'. The second option is the decoupled mode where a DMA channel can access any or all NAND chip selects connected to the GPMI. A DMA channel will signify the NAND chip select it wants to access by writing its chip select value in the GPMI_CTRL0[CS] field and setting the GPMI_CTRL1[DECOUPLE_CS] to 1. This option is useful if software chooses to use only one DMA channel to access all the attached NAND devices.

30.4.2 GPMI NAND Timing and Clocking

The dedicated clock, GPMICK, is used as a timing reference for NAND flash I/O. Since various NANDs have different timing requirements, GPMICK may need to be adjusted for each application.

While the actual pin timings are limited by the NAND chips used and the I/O pad configuration, the GPMI can support data bus speeds of up to 200 MHz x 8 bits. The actual read/write strobe timing parameters are adjusted as indicated in the register descriptions in Memory Map.

30.4.3 Basic NAND Timing

30.4.3.1 NAND Asynchronous Timing

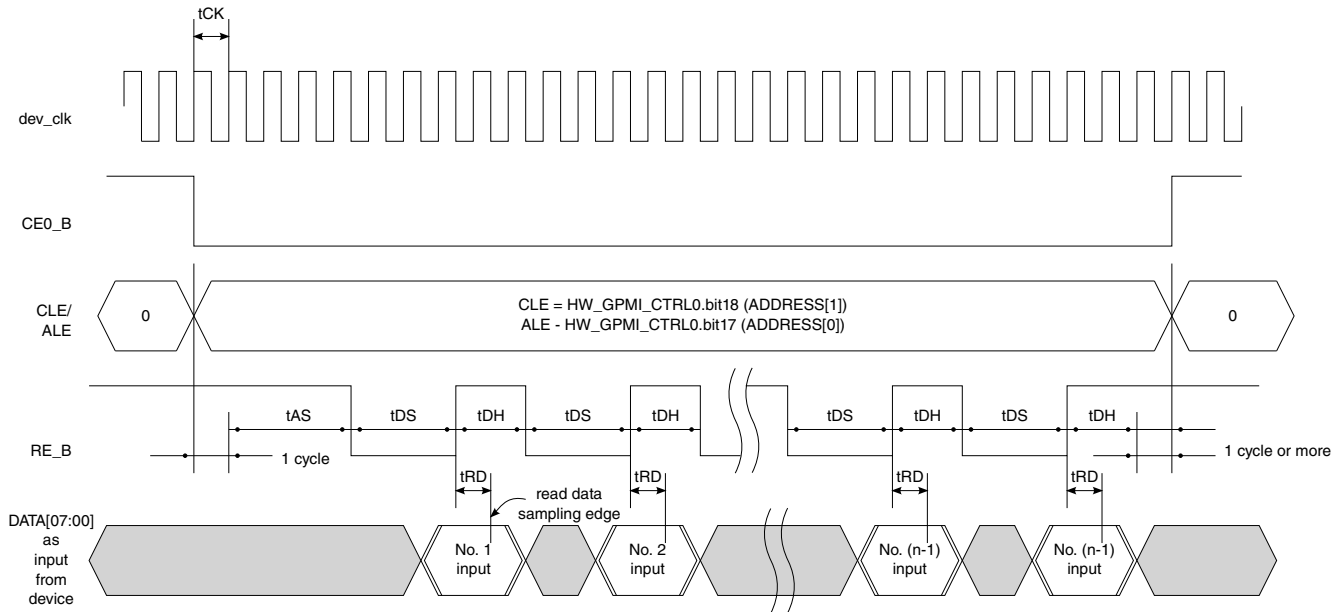

[Figure 30-3](#) and illustrates the operation of the output (from host to device) timing parameters in NAND ONFI asynchronous mode.

GPMI NAND Mode

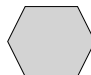

- t_{AS} is configurable by programming HW_GPMI_TIMING0 Address_Setup; in this example, Address_Setup = 4, t_{AS} is equal to 4 dev_clk cycles.
- t_{DS} is configurable by programming HW_GPMI_TIMING0 Data_Setup; in this example, Data_Setup = 3, t_{DS} is equal to 3 dev_clk cycles
- t_{DH} is configurable by programming HW_GPMI_TIMING0 Data_Hold; in this example, Data_Hold = 2, t_{DH} is equal to 2 dev_clk cycles
- $t_{AS}/t_{DS}/t_{DH}$ will extend, if the output data is not ready in device fifo.

Figure 30-2. Asynchronous Mode Basic Write Timing Diagram (command write, address write, or data write)

- tAS is configurable by programming HW_GPMI_TIMING0 Address_Setup; in this example, Address_Setup = 4, tAS is equal to 4 dev_clk cycles.
- tDS is configurable by programming HW_GPMI_TIMING0 Data_Setup; in this example, Data_Setup = 3, tDS is equal to 3 dev_clk cycles
- tDH is configurable by programming HW_GPMI_TIMING0 Data_Hold; in this example, Data_Hold = 2, tDH is equal to 2 dev_clk cycles
- tRD is the delay from RE_B rising edge to the read data sampling edge. If SDR DLL is not enabled, tRD is 0. If SDR DLL enabled, the delay depends on SDR DLL delay.
- tAS/tDS/tDH will extend, if the output data is not ready in device fifo.

 Host controller drives the DATA[07:00] bus
And also don't care if device will drive that or not and what will be driven

ONFI asynchronous mode basic read timing diagram
(data read)

Figure 30-3. ONFI Asynchronous Mode Basic Read Timing Diagram (data read)

30.4.3.2 NAND Asynchronous EDO Mode Timing

In high-speed NANDS, the read data may not be valid until after the read strobe (NAND_RE_B) deasserts. This is the case when the minimum tDS is programmed to achieve higher bandwidth.

The GPMI implements a feedback read strobe to sample the read data. The feedback read strobe can be delayed to support fast nand EDO (Extended Data Out) timing where the read strobe may deassert before the read data is valid, and read data is valid for some time after read strobe. Nand EDO timings is applied typically for read cycle frequency above 33 MHz. See [Figure 30-4](#).

The GPMI provides control over the amount of delay applied to the feedback read strobe. This delay depends on the maximum read access time (tREA) of the nand and the read pulse width (tRP) used to access the nand. tRP is specified by GPMI_TIMING0[DATA_SETUP] register. When (tREA + 4ns) is less than tRP, no

delay is required to sample to nand read data. (The 4ns provides adequate data setup time for the GPMI.) In this case set `GPMI_CTRL1[HALF_PERIOD] = 0;`
`GPMI_CTRL1[RDN_DELAY] = 0;` `GPMI_CTRL1[DLL_ENABLE] = 0.`

When $(t_{REA} + 4ns)$ is greater than or equal to t_{RP} , a delay of the feedback read strobe is required to sample to nand read data. This delay is equal to the difference between these two timings:

$$DELAY = t_{REA} + 4ns - t_{RP}.$$

Since the GPMI delay chain is limited to ns maximum, if $DELAY > ns$ then increase t_{RP} by increasing the value of `GPMI_TIMING0[DATA_SETUP]` until $DELAY$ is less than or equal to ns.

The GPMI programming for this $DELAY$ depends on the GPMICLK period. The GPMI DLL will not function properly if the GPMICLK period is greater than ns: disable the DLL if this is the case. If the GPMICLK period is greater than ns (and not greater than ns), set the `GPMI_CTRL1[HALF_PERIOD]=1;` This will cause the DLL reference period (RP) to be one-half of the GPMICLK period. If the GPMICLK period is ns or less then set the `GPMI_CTRL1[HALF_PERIOD]=0;` This will cause the DLL reference period (RP) to be equal to the GPMICLK period. $DELAY$ is a multiple (0 to 1.875) of RP.

The `GPMI_CTRL1[RDN_DELAY]` is encoded as a 1-bit integer and 3-bit fraction delay factor. $DELAY$ is a multiple of the delay factor and the reference period. See table below for details.

Table 30-3. RDN DELAY

HW_GPMI_CTRL1[RDN_DELAY]	Delay Factor
0	0.000
1	0.125
2	0.250
3	0.375
4	0.500
5	0.625
6	0.750
7	0.875
8	1.000
9	1.125
10	1.250
11	1.375
12	1.500
13	1.625

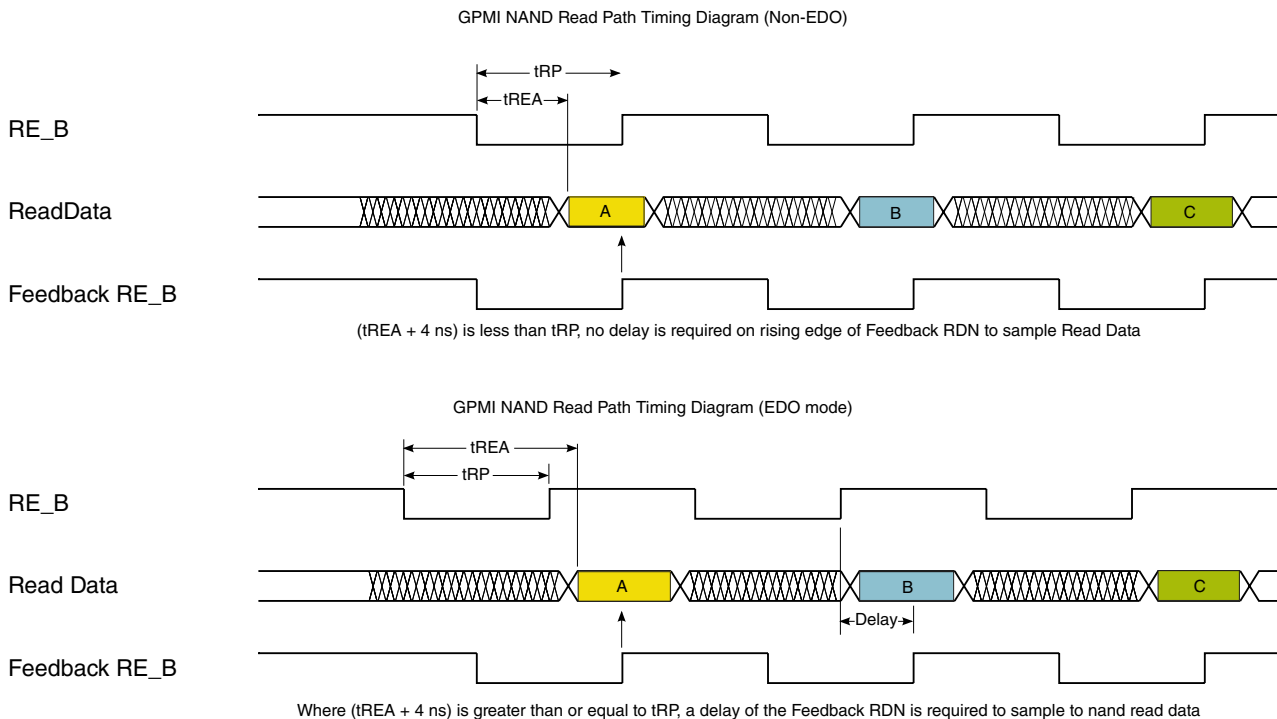

Table continues on the next page...

Table 30-3. RDN DELAY (continued)

HW_GPMI_CTRL1[RDN_DELAY]	Delay Factor
14	1.750
15	1.875

$DELAY = DelayFactor \times RP$ or $DELAY = GPMI_CTRL1[RDN_DELAY] \times 0.125 \times RP$.

Use this equation to calculate the value for GPMI_CTRL1[RDN_DELAY]. Then set GPMI_CTRL1[DLL_ENABLE]=1.

**Figure 30-4. NAND Read Path Timing**

For example, a NAND with $tRE_{max} = 20$ ns, $tRP_{min} = 12$ ns, and $tRC_{min} = 25$ ns (read cycle time) may be programmed as follows:

- GPMICK clock frequency: Consider $480/6 = 80$ MHz which is 12.5 ns clock period. This is too close to the minimum NAND spec if we program the data setup and hold to 1 GPMICK cycle. Consider $480/7 = 68.57$ MHz which is 14.58 ns clock period. With data setup and hold set to 1, we have a tRP of 14.58 ns and a tRC of 29.16 ns (good margins).
- Since $(tREA + 4ns)$ is greater than tRP , required $DELAY = tREA + 4ns - tRP = 20 + 4 - 14.58ns = 9.42$ ns.

- $\text{GPMI_CTRL1}[\text{HALF_PERIOD}] =$, since GPMICLK period is ns. So $\text{RP} = \text{GPMICLK period} = \text{ns}$.
- $\text{DELAY} = \text{GPMI_CTRL1}[\text{RDN_DELAY}] \times 0.125 \times \text{RP}$. $9.42 \text{ ns} = \text{GPMI_CTRL1}[\text{RDN_DELAY}] \times 0.125 \times \text{ns}$. $\text{GPMI_CTRL1}[\text{RDN_DELAY}] =$

NOTE

It is recommended that the drive strength of NAND_RE_B and NAND_WE_B output pins be set to 8 mA. This will reduce the transition time under heavy loads. Low transition times will be important when NAND interface read and write cycle times are below 30 ns. The other GPMI pins may remain at 4 mA, since their frequency is only up to half that of NAND_RE_B and NAND_WE_B.

30.4.3.3 NAND ONFI Source Synchronous Mode Timing

NOTE

In the following figures, CLK shares the same pin as WE_B in Async Mode. And W/R# shares the same pin as RE_B in Async Mode.

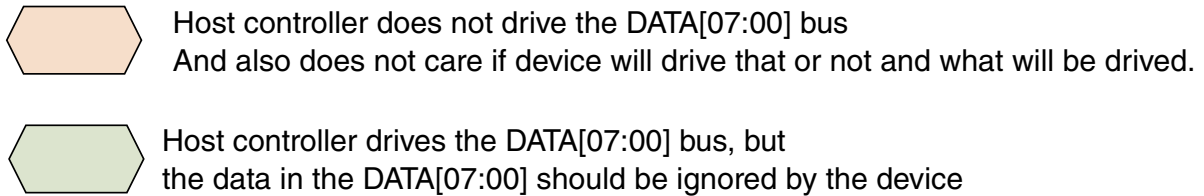

Figure 30-16. Toggle Mode Program Timing Diagram (B)

Figure 30-17. Toggle Mode Program Timing Diagram (C)

30.4.4 Hardware BCH Interface

The GPMI provides an interface to the BCH module. This reduces the SOC bus traffic and the software involvement.

When BCH ECC is enable, parity information is inserted on-the-fly during writes to 8-bit NAND devices. The BCH will supply payload and parity to the GPMI to write to the NAND. During NAND reads, parity is checked and ECC processing is performed after each read block. In this case the GPMI reads the NAND device and redirects the data and parity to the BCH module for ECC processing.

To program the BCH for NAND writes, remove the soft reset and clock gates from BCH_CTRL[SFTRST] and BCH_CTRL[CLKGATE]. The bulk of BCH programming is actually applied to the GPMI via PIO operations embedded in its DMA command structures. This has a subtle implication when writing to the GPMI ECC registers: access to these registers must be written in progressive register order. Thus, to write to the GPMI_ECCCOUNT register, write first (in order) to registers GPMI_CTRL0, GPMI_COMPARE, and GPMI_ECCCTRL before writing to GPMI_ECCCOUNT. These additional register writes need to be accounted for in the CMDWORDS field of the respective DMA channel command register.

NOTE

Note that the GPMI_PAYLOAD and GPMI_AUXILIARY pointers need to be word-aligned for proper ECC operation. If those pointers are non-word-aligned, then the BCH engine will not operate properly and could possibly corrupt system memory in the adjoining memory regions.

30.5 Behavior During Reset

A soft reset (SFTRST) can take multiple clock periods to complete, so do NOT set CLKGATE when setting SFTRST. The reset process gates the clocks automatically.

30.6 GPMI Memory Map/Register Definition

The following registers provide control for programmable elements of the GPMI module.

NOTE

All ATA or UDMA features are not supported for the chip.

30.6.1 GPMI Control Register 0 Description (GPMI_CTRL0n)

The GPMI control register 0 specifies the GPMI transaction to perform for the current command chain item.

Address: 180_6000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W	SFTRST	CLKGATE	RUN	DEV_IRQ_EN	LOCK_CS	UDMA	COMMAND_MODE	WORD_LENGTH		CS		ADDRESS			ADDRESS_INCREMENT	
Reset	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_CTRL0n field descriptions

Field	Description
31 SFTRST	Set to zero for normal operation. When this bit is set to one (default), then the entire block is held in its reset state. This will not work if the CLKGATE bit is already set to '1'. CLKGATE must be cleared to '0' before issuing a soft reset. Also the GPMICLK must be running for this to work properly. RUN = 0x0 Allow GPMI to operate normally. RESET = 0x1 Hold GPMI in reset.
30 CLKGATE	Set this bit zero for normal operation. Setting this bit to one (default), gates all of the block level clocks off for minimizing AC energy consumption. RUN = 0x0 Allow GPMI to operate normally. NO_CLKS = 0x1 Do not clock GPMI gates in order to minimize power consumption.
29 RUN	The GPMI is busy running a command whenever this bit is set to '1'. The GPMI is idle whenever this bit set to zero. This can be set to one by a CPU write. In addition, the DMA sets this bit each time a DMA command has finished its PIO transfer phase. IDLE = 0x0 The GPMI is idle. BUSY = 0x1 The GPMI is busy running a command.

Table continues on the next page...

GPMI_CTRL0n field descriptions (continued)

Field	Description
28 DEV_IRQ_EN	When set to '1' and ATA_IRQ pin is asserted, the GPMI_IRQ output will assert.
27 LOCK_CS	For ATA/NAND mode: 0= Deassert chip select (CS) after RUN is complete. 1= Continue to assert chip select (CS) after RUN is complete. For Camera Mode: 0= Dont wait for VSYNC rising edge before capturing data. 1= Wait for VSYNC rising edge before capturing data (Camera mode only). DISABLED = 0x0 Deassert chip select (CS) after RUN is complete. ENABLED = 0x1 Continue to assert chip select (CS) after RUN is complete.
26 UDMA	DISABLED = 0x0 Use ATA-PIO mode on the external bus. ENABLED = 0x1 Use ATA-Ultra DMA mode on the external bus. 0 Use ATA-PIO mode on the external bus. 1 Use ATA-Ultra DMA mode on the external bus.
25–24 COMMAND_ MODE	WRITE = 0x0 Write mode. READ = 0x1 Read mode. READ_AND_COMPARE = 0x2 Read and Compare mode (setting sense flop). WAIT_FOR_READY = 0x3 Wait for Ready mode. For ATA WAIT_FOR_READY command set CS=01. 00 Write mode. 01 Read Mode. 10 Read and Compare Mode (setting sense flop). 11 Wait for Ready.
23 WORD_LENGTH	This bit should only be changed when RUN==0. Reserve = 0x0 Reserved. 8_BIT = 0x1 8-bit Data Bus mode. 0 Reserved. 1 8-bit Data Bus mode.
22–20 CS	Selects which chip select is active for this command. For ATA WAIT_FOR_READY command, this must be set to b01.
19–17 ADDRESS	Specifies the three address lines for ATA mode. In NAND mode, use A0 for CLE and A1 for ALE. NAND_DATA = 0x0 In NAND mode, this address is used to read and write data bytes. NAND_CLE = 0x1 In NAND mode, this address is used to write command bytes. NAND_ALE = 0x2 In NAND mode, this address is used to write address bytes.
16 ADDRESS_ INCREMENT	In ATA mode, the address will increment with each cycle. In NAND mode, the address will increment once, after the first cycle (going from CLE to ALE). DISABLED = 0x0 Address does not increment. ENABLED = 0x1 Increment address. 0 Address does not increment. 1 Increment address.
XFER_COUNT	Number of bytes to transfer for this command. A value of zero will transfer 64K bytes.

30.6.2 GPMI Compare Register Description (GPMI_COMPARE)

The GPMI compare register specifies the expect data and the xor mask for comparing to the status values read from the device. This register is used by the Read and Compare command.

GPMI_COMPARE 0x010

Address: 180_6000h base + 10h offset = 180_6010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	MASK																REFERENCE															
W	MASK																REFERENCE															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_COMPARE field descriptions

Field	Description
31–16 MASK	16-bit mask which is applied after the read data is XORed with the REFERENCE bit field.
REFERENCE	16-bit value which is XORed with data read from the NAND device.

30.6.3 GPMI Integrated ECC Control Register Description (GPMI_ECCCTRLn)

The GPMI ECC control register handles configuration of the integrated ECC accelerator.

Address: 180_6000h base + 20h offset + (4d × i), where i=0d to 3d

GPMI_ECCCTRLn field descriptions

Field	Description
31–16 HANDLE	This is a register available to software to attach an identifier to a transaction in progress. This handle will be available from the ECC register space when the completion interrupt occurs.
15 RSVD2	Always write zeroes to this bit field.
14–13 ECC_CMD	ECC Command information. DECODE = 0x0 Decode. ENCODE = 0x1 Encode. RESERVE2 = 0x2 Reserved. RESERVE3 = 0x3 Reserved.

Table continues on the next page...

GPMI_ECCCTRLn field descriptions (continued)

Field	Description
12 ENABLE_ECC	Enable ECC processing of GPMI transfers. ENABLE = 0x1 Use integrated ECC for read and write transfers. DISABLE = 0x0 Integrated ECC remains in idle.
11–9 RSVD1	Always write zeroes to this bit field.
BUFFER_MASK	ECC buffer information. The BCH error correction only allows two configurations of the buffer mask - software may either read just the first block on the flash page or the entire flash page. Write operations must be for the entire flash page. Invalid buffer mask values will cause the DMA descriptor command to be terminated. BCH_AUXONLY = 0x100 Set to request transfer from only the auxiliary buffer (block 0 on flash). BCH_PAGE = 0x1FF Set to request transfer to/from the entire page.

30.6.4 GPMI Integrated ECC Transfer Count Register Description (GPMI_ECCECOUNT)

The GPMI ECC Transfer Count Register contains the count of bytes that flow through the ECC subsystem.

GPMI_ECCECOUNT 0x030

Address: 180_6000h base + 30h offset = 180_6030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD2																COUNT															
W	0																0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

GPMI_ECCECOUNT field descriptions

Field	Description
31–16 RSVD2	Always write zeroes to this bit field.
COUNT	Number of bytes to pass through ECC. This is the GPMI transfer count plus the syndrome count that will be inserted into the stream by the ECC. In DMA2ECC_MODE this count must match the GPMI_CTRL0_XFER_COUNT. A value of zero will transfer 64K words.

30.6.5 GPMI Payload Address Register Description (GPMI_PAYLOAD)

The GPMI payload address register specifies the location of the data buffers in system memory. This value must be word aligned.

GPMI_PAYLOAD 0x040

GPMI Memory Map/Register Definition

Address: 180_6000h base + 40h offset = 180_6040h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

GPMI_PAYLOAD field descriptions

Field	Description
31–2 ADDRESS	Pointer to an array of one or more 512 byte payload buffers.
RSVD0	Always write zeroes to this bit field.

30.6.6 GPMI Auxiliary Address Register Description (GPMI_AUXILIARY)

The GPMI auxiliary address register specifies the location of the auxiliary buffers in system memory. This value must be word aligned.

GPMI_AUXILIARY 0x050

Address: 180_6000h base + 50h offset = 180_6050h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

GPMI_AUXILIARY field descriptions

Field	Description
31–2 ADDRESS	Pointer to ECC control structure and meta-data storage.
RSVD0	Always write zeroes to this bit field.

30.6.7 GPMI Control Register 1 Description (GPMI_CTRL1n)

The GPMI control register 1 specifies additional control fields that are not used on a per-transaction basis.

Address: 180_6000h base + 60h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W	DEV_CLK_STOP	SSYNC_CLK_STOP	WRITE_CLK_STOP	TOGGLE_MODE	GPMI_CLK_DIV2_EN	UPDATE_CS	SSYNCMODE	DECOUPLE_CS	WRN_DLY_SEL	TEST_TRIGGER	TIMEOUT_IRQ_EN	GANGED_RDYBUSY	BCH_MODE	DLL_ENABLE	HALF_PERIOD	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

GPMI_CTRL1n field descriptions

Field	Description
31 DEV_CLK_STOP	set this bit to 1 will stop gpmi io working clk.
30 SSYNC_CLK_STOP	set this bit to 1 will stop the source synchronous mode clk.
29 WRITE_CLK_STOP	In onfi source synchronous mode, host may save power during the data write cycles by holding the CLK signal high (i.e. stopping the CLK). The host may only stop the CLK during data write, by setting this bit to 1, if the device supports this feature as indicated in the parameter page.
28 TOGGLE_MODE	enable samsung toggle mode.
27 GPMI_CLK_DIV2_EN	This bit should be reset to 0 in asynchronous mode. The frequency ratio of (device clock : ccm gpmi clock) will be (1 : 1). This bit should be set to 1, in source synchronous mode or toggle mode. The frequency ratio of (device clock : ccm gpmi clock) will be (1 : 2). enable the gpmi clk divider. 0x0 internal factor-2 clock divider is disabled 0x1 internal factor-2 clock divider is enabled.

Table continues on the next page...

GPMI_CTRL1n field descriptions (continued)

Field	Description
26 UPDATE_CS	force the CS value is be updated to external chip select pin, even GPMI is idle.
25 SSYNCMODE	source synchronous mode 1 or asynchronous mode 0. ASYNC = 0x0 Asynchronous mode. SSYNC = 0x1 Source Synchronous mode.
24 DECOUPLE_CS	Decouple Chip Select from DMA Channel. Setting this bit to 1 will allow a DMA channel to specify any value in the CTRL0_CS register field. Software can use one DMA channel to access all 8 Nand devices.
23–22 WRN_DLY_SEL	Since the GPMI write strobe (WRN) is a fast clock pin, the delay on this signal can be programmed to match the load on this pin. 0 = ~2ns; 1 = ~4ns; 2 = ~6ns; 3 = no delay.
21 TEST_TRIGGER	Test Trigger Enable 0 Disable 1 Enable
20 TIMEOUT_IRQ_EN	Setting this bit to '1' will enable timeout IRQ for transfers in ATA mode only, and for WAIT_FOR_READY commands in both ATA and Nand mode. The Device_Busy_Timeout value is used for this timeout.
19 GANGED_RDYBUSY	Set this bit to 1 will force all Nand RDY_BUSY inputs to be sourced from (tied to) RDY_BUSY0. This will free up all, except one, RDY_BUSY input pins.
18 BCH_MODE	This bit selects which error correction unit will access GPMI. This bit must always be set to '1', since only the BCH unit is available in this design.
17 DLL_ENABLE	Set this bit to 1 to enable the GPMI DLL. This is required for fast NAND reads (above 30 MHz read strobe). After setting this bit, wait 64 GPMI clock cycles for the DLL to lock before performing a NAND read.
16 HALF_PERIOD	Set this bit to 1 if the GPMI clock period is greater than 16ns for proper DLL operation. DLL_ENABLE must be zero while changing this field.
15–12 RDN_DELAY	This variable is a factor in the calculated delay to apply to the internal read strobe for correct read data sampling. The applied delay (AD) is between 0 and 1.875 times the reference period (RP). RP is one half of the GPMI clock period if HALF_PERIOD=1 otherwise it is the full GPMI clock period. The equation is: $AD = RDN_DELAY \times 0.125 \times RP$. This value must not exceed 16ns. This variable is used to achieve faster NAND access. For example if the Read Strobe is asserted from time 0 to 13ns but the read access time is 20ns, then choose AD=12ns will cause the data to be sampled at time 25ns (13+12) giving a 5ns data setup time. If RP=13ns then $RDN_DELAY = 12 / (0.125 \times 13ns)$ = 7.38 (0111b). DLL_ENABLE must be zero while changing this field.
11 DMA2ECC_MODE	This is mainly for testing HWECC without involving the Nand device. Setting this bit will cause DMA write data to redirected to HWECC module (instead of Nand Device) for encoding or decoding.
10 DEV_IRQ	This bit is set when an Interrupt is received from the ATA device. Write 0 to clear.
9 TIMEOUT_IRQ	This bit is set when a timeout occurs using the Device_Busy_Timeout value. Write 0 to clear.

Table continues on the next page...

GPMI_CTRL1n field descriptions (continued)

Field	Description
8 BURST_EN	When set to 1 each DMA request will generate a 4-transfer burst on the APB bus.
7 ABORT_WAIT_REQUEST	Request to abort "wait for ready" command on channel indicated by ABORT_WAIT_FOR_READY_CHANNEL. Hardware will clear this bit when abort is done.
6–4 ABORT_WAIT_FOR_READY_CHANNEL	Abort a wait for ready command on selected channel. Set the ABORT_WAIT_REQUEST to kick of operation.
3 DEV_RESET	ENABLED = 0x0 NANDF_WP_B(WPN) pin is held low (asserted). DISABLED = 0x1 NANDF_WP_B(WPN) pin is held high (de-asserted). 0 NANDF_WP_B pin is held low (asserted). 1 NANDF_WP_B pin is held high (de-asserted).
2 ATA_IRQRDY_POLARITY	For ATA MODE: Note NAND_RDY_BUSY[3:2] are not affected by this bit. ACTIVELOW = 0x0 ATA IORDY and IRQ are active low, or NAND_RDY_BUSY[1:0] are active low ready. ACTIVEHIGH = 0x1 ATA IORDY and IRQ are active high, or NAND_RDY_BUSY[1:0] are active high ready. 0 External ATA IORDY and IRQ are active low. 1 External ATA IORDY and IRQ are active high. For NAND MODE: 0 External RDY_BUSY[1] and RDY_BUSY[0] pins are ready when low and busy when high. 1 External RDY_BUSY[1] and RDY_BUSY[0] pins are ready when high and busy when low.
1 CAMERA_MODE	When set to 1 and ATA UDMA is enabled the UDMA interface becomes a camera interface.
0 GPMI_MODE	ATA mode is only supported on channel zero. If ATA mode is selected, then only channel three is available for NAND use. NAND = 0x0 NAND mode. ATA = 0x1 ATA mode. 0 NAND mode. 1 ATA mode.

30.6.8 GPMI Timing Register 0 Description (GPMI_TIMING0)

The GPMI timing register 0 specifies the timing parameters that are used by the cycle state machine to guarantee the various setup, hold and cycle times for the external media type.

GPMI_TIMING0 0x070

GPMI Memory Map/Register Definition

Address: 180_6000h base + 70h offset = 180_6070h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPMI_TIMING0 field descriptions

Field	Description
31–24 RSVD1	Always write zeroes to this bit field.
23–16 ADDRESS_SETUP	Number of GPMICLK cycles that the CE/ADDR signals are active before a strobe is asserted. A value of zero is interpreted as 0. For ATA PIO modes this is known in the ATA7 specification as "Address valid to DIOR-/DIOW- setup"
15–8 DATA_HOLD	Data bus hold time in GPMICLK cycles. Also the time that the data strobe is de-asserted in a cycle. A value of zero is interpreted as 256. For ATA PIO modes this is known in the ATA7 specification as "DIOR-/DIOW- recovery time"
DATA_SETUP	Data bus setup time in GPMICLK cycles. Also the time that the data strobe is asserted in a cycle. This value must be greater than 2 for ATA devices that use IORDY to extend transfer cycles. A value of zero is interpreted as 256. For ATA PIO modes this is known in the ATA7 specification as ""DIOR-/DIOW-"

30.6.9 GPMI Timing Register 1 Description (GPMI_TIMING1)

The GPMI timing register 1 specifies the timeouts used when monitoring the NAND READY pin or the ATA IRQ and IOWAIT signals.

GPMI_TIMING1 0x080

Address: 180_6000h base + 80h offset = 180_6080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPMI_TIMING1 field descriptions

Field	Description
31–16 DEVICE_BUSY_TIMEOUT	Timeout waiting for NAND Ready/Busy or ATA IRQ. Used in WAIT_FOR_READY mode. This value is the number of GPMI_CLK cycles multiplied by 4096.
RSVD1	Always write zeroes to this bit field.

30.6.10 GPMI Timing Register 2 Description (GPMI_TIMING2)

The GPMI timing register 2 specifies the double data rate timing parameters that are used by the cycle state machine to guarantee the various cs delay, pre-amble delay, post-amble delay, command/address delay, data delay, TCR, TRPSTH, and read latency cycle times for the external media type.

GPMI_TIMING2 0x090

Address: 180_6000h base + 90h offset = 180_6090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPMI_TIMING2 field descriptions

Field	Description
31–29 TRPSTH	Only for Toggle NAND timing control delay TRPSTH GPMICK cycles for CEn_B high to RE_B high, A value of zero is interpreted as 8
28–27 TCR	Only for Toggle NAND timing control delay (TCR+1) GPMICK cycles for CEn_B low to RE_B low, 0 is less than or equal to TCR, which is less than the PREAMBLE_DELAY
26–24 READ_ LATENCY	This field is for double data rate read latency configuration. others READ LATENCY is 3 000 READ LATENCY is 0 001 READ LATENCY is 1 010 READ LATENCY is 2 011 READ LATENCY is 3 100 READ LATENCY is 4 101 READ LATENCY is 5
23–21 RSVD0	Always write zeroes to this bit field.
20–16 CE_DELAY	GPMI delay from CEn assert to W/Rn changing edge. value of zero is interpreted as 32.
15–12 PREAMBLE_ DELAY	GPMI pre-amble delay in GPMICK cycles. A value of zero is interpreted as 16.
11–8 POSTAMBLE_ DELAY	GPMI post-amble delay in GPMICK cycles. A value of zero is interpreted as 16.
7–4 CMDADD_ PAUSE	GPMI delay time from command or address pause to command or address resume in GPMICK cycles. A value of zero is interpreted as 16.
DATA_PAUSE	GPMI delay time from data pause to data resume in GPMICK cycles. A value of zero is interpreted as 16.

30.6.11 GPMI DMA Data Transfer Register Description (GPMI_DATA)

The GPMI DMA data transfer register is used by the DMA to read or write data to or from the ATA/NAND control state machine.

GPMI_DATA 0x0A0

Address: 180_6000h base + A0h offset = 180_60A0h

GPMI_DATA field descriptions

Field	Description
DATA	In 8-bit mode, one, two, three or four bytes can be accessed to send the same number of bus cycles.

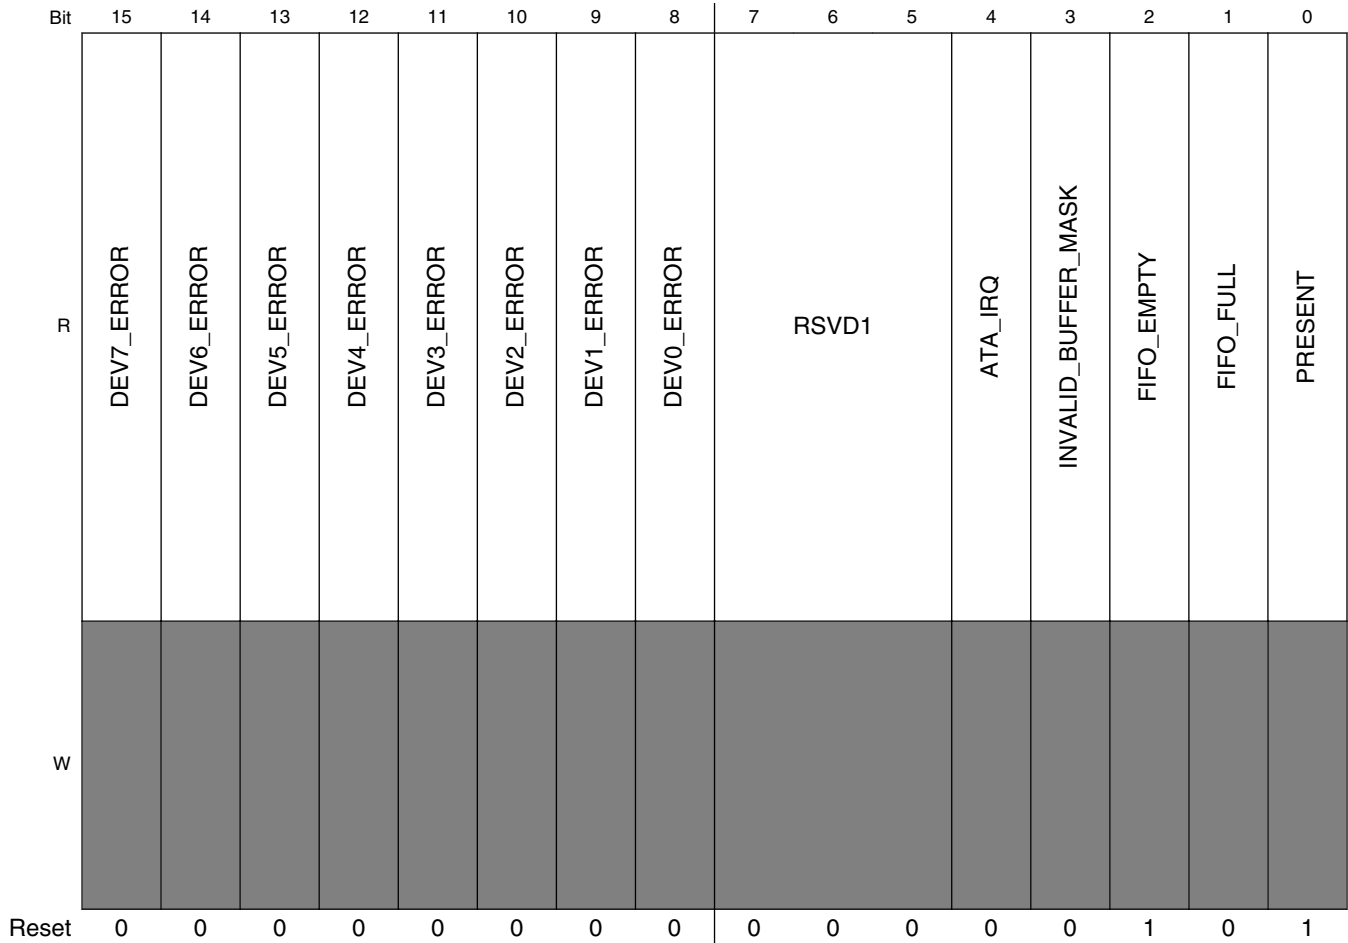

30.6.12 GPMI Status Register Description (GPMI_STAT)

The GPMI control and status register provides a read back path for various operational states of the GPMI controller.

GPMI_STAT 0x0B0

Address: 180_6000h base + B0h offset = 180_60B0h

GPMI_STAT field descriptions

Field	Description
31-24 READY_BUSY	Read-only view of NAND Ready_Busy Input pins.
23-16 RDY_TIMEOUT	<p>State of the RDY/BUSY Timeout Flags. When any bit is set to '1' in this field, it indicates that a time out has occurred while waiting for the ready state of the requested NAND device. Multiple bits may be set simultaneously.</p> <p>When GPMI_CTRL1_DECOUPLE_CS = 0, RDY_TIMEOUT[n] is associated with the NAND device on chip_select[n].</p> <p>When GPMI_CTRL1_DECOUPLE_CS = 1, these flags become associated to a DMA channel instead of a NAND device.</p> <p>For example if DMA channel 6 sends a WAIT_FOR_READY command for NAND Device 2, and a timeout occurred on READY_BUSY2, then READY_TIMEOUT[6] will be set instead of READY_TIMEOUT[2].</p>
15 DEV7_ERROR	<p>DMA channel 7 (Timeout or compare failure, depending on COMMAND_MODE).</p> <p>0 No error condition present on ATA/NAND Device accessed by DMA channel 7.</p> <p>1 An Error has occurred on ATA/NAND Device accessed by</p>

Table continues on the next page...

GPMI_STAT field descriptions (continued)

Field	Description
14 DEV6_ERROR	DMA channel 6 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 6. 1 An Error has occurred on ATA/NAND Device accessed by
13 DEV5_ERROR	DMA channel 5 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 5. 1 An Error has occurred on ATA/NAND Device accessed by
12 DEV4_ERROR	DMA channel 4 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 4. 1 An Error has occurred on ATA/NAND Device accessed by
11 DEV3_ERROR	DMA channel 3 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 3. 1 An Error has occurred on ATA/NAND Device accessed by
10 DEV2_ERROR	DMA channel 2 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 2. 1 An Error has occurred on ATA/NAND Device accessed by
9 DEV1_ERROR	DMA channel 1 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 1. 1 An Error has occurred on ATA/NAND Device accessed by
8 DEV0_ERROR	DMA channel 0 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 0. 1 An Error has occurred on ATA/NAND Device accessed by
7-5 RSVD1	Always write zeroes to this bit field.
4 ATA_IRQ	Status of the ATA_IRQ input pin.
3 INVALID_BUFFER_MASK	Buffer Mask Validity bit. 0 ECC Buffer Mask is not invalid. 1 ECC Buffer Mask is invalid.
2 FIFO_EMPTY	NOT_EMPTY = 0x0 FIFO is not empty. EMPTY = 0x1 FIFO is empty. 0 FIFO is not empty. 1 FIFO is empty.
1 FIFO_FULL	NOT_FULL = 0x0 FIFO is not full. FULL = 0x1 FIFO is full. 0 FIFO is not full. 1 FIFO is full.
0 PRESENT	UNAVAILABLE = 0x0 GPMI is not present in this product. AVAILABLE = 0x1 GPMI is present in this product.

Table continues on the next page...

Field	Description
0	GPMI is not present in this product.
1	GPMI is present is in this product.

30.6.13 GPMI Debug Information Register Description (GPMI_DEBUG)

The GPMI debug information register provides a read back path for diagnostics to determine the current operating state of the GPMI controller.

GPMI_DEBUG 0x0C0

Address: 180_6000h base + C0h offset = 180_60C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
R	WAIT_FOR_READY_END								DMA_SENSE								DMAREQ								CMD_END																							
W	[Shaded]																																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_DEBUG field descriptions

Field	Description
31–24 WAIT_FOR_READY_END	Read Only view of the Wait_For_Ready End toggle signals to DMA. One per channel
23–16 DMA_SENSE	Read-only view of sense state of the 8 DMA channels. A value of "1" in any bit position indicates that a read and compare command failed or a timeout occurred for the corresponding channel.
15–8 DMAREQ	Read-only view of DMA request line for 8 DMA channels. A toggle on any bit position indicates a DMA request for the corresponding channel.
CMD_END	Read Only view of the Command End toggle signals to DMA. One per channel

30.6.14 GPMI Version Register Description (GPMI_VERSION)

This register reflects the version number for the GPMI.

GPMI_VERSION 0x0D0

Address: 180_6000h base + D0h offset = 180_60D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	MAJOR								MINOR								STEP																
W	[Shaded]																																
Reset	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_VERSION field descriptions

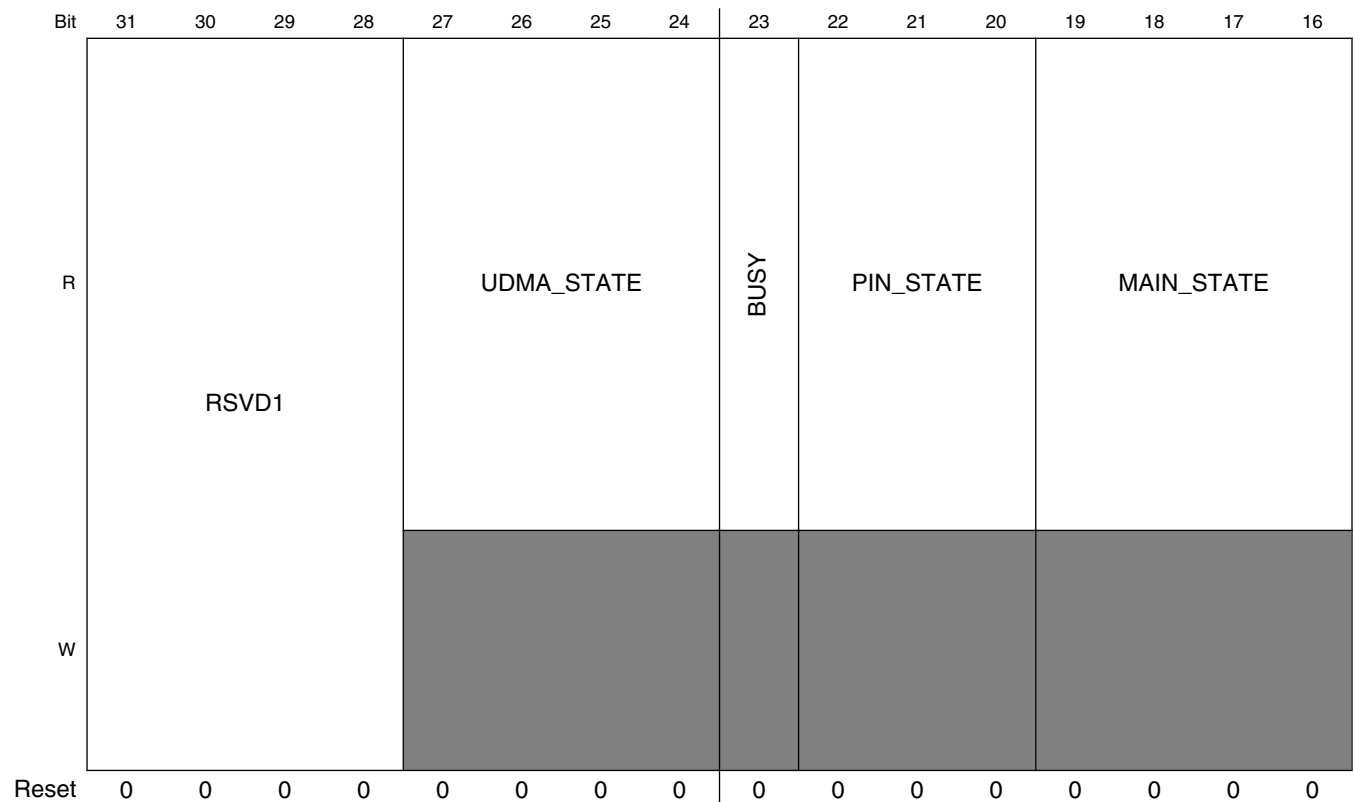

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

30.6.15 GPMI Debug2 Information Register Description (GPMI_DEBUG2)

The GPMI Debug2 information register provides a read back path for diagnostics to determine the current operating state of the GPMI controller.

GPMI_DEBUG2 0x0E0

Address: 180_6000h base + E0h offset = 180_60E0h

GPMI_DEBUG2 field descriptions

Field	Description
31-28 RSVD1	Always write zeroes to this bit field.

W	0																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_DEBUG3 field descriptions

Field	Description
31-16 APB_WORD_ CNTR	Reflects the number of bytes remains to be transferred on the APB bus.
DEV_WORD_ CNTR	Reflects the number of bytes remains to be transferred on the ATA/Nand bus.

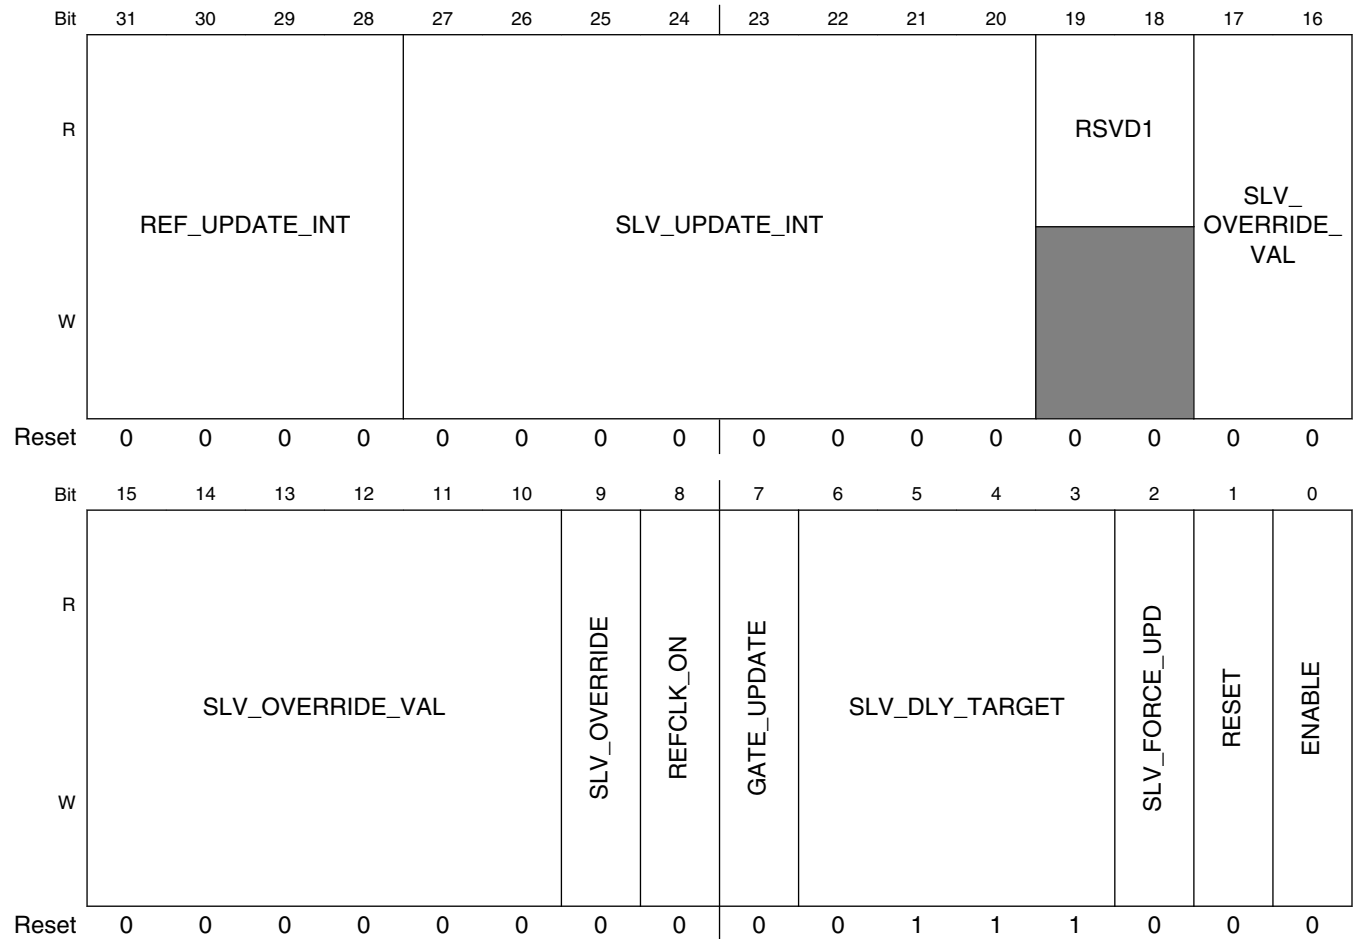

30.6.17 GPMI Double Rate Read DLL Control Register Description (GPMI_READ_DDR_DLL_CTRL)

GPMI DDR Read Delay Loop Lock Control Register. This register provides programmability in DDR mode for data input timing and data formats.

GPMI_READ_DDR_DLL_CTRL 0x100

GPMI Memory Map/Register Definition

Address: 180_6000h base + 100h offset = 180_6100h

GPMI_READ_DDR_DLL_CTRL field descriptions

Field	Description
31–28 REF_UPDATE_INT	This field allows the user to add additional delay cycles to the DLL control loop (reference delay line control). By default, the DLL control loop shall update every two GPMICLK cycles. Programming this field results in a DLL control loop update interval of $(2 + \text{REF_UPDATE_INT}) * \text{GPMICLK}$. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–20 SLV_UPDATE_INT	Setting a value greater than 0 in this field, shall over-ride the default slave delay-line update interval of 256 GPMICLK cycles. A value of 0 results in an update interval of 256 GPMICLK cycles (default setting). A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
19–18 RSVD1	Reserved
17–10 SLV_OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 256 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 256.
9 SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to be enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0

Table continues on the next page...

GPMI_READ_DDR_DLL_CTRL field descriptions (continued)

Field	Description
8 REFCLK_ON	set this bit to 1 will turn on the reference clock
7 GATE_UPDATE	Setting this bit to 1, forces the slave delay line not update
6–3 SLV_DLY_TARGET	The delay target for the read clock is can be programmed in 1/16th increments of an GPMICLK half-period. So the input read-clock can be delayed relative input data from (GPMICLK/2)/16 to GPMICLK/2.
2 SLV_FORCE_UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered).
1 RESET	Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-calibrate to detect an GPMICLK half period phase shift. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again.
0 ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE_VAL, the DLL does not need to be enabled.

30.6.18 GPMI Double Rate Write DLL Control Register Description (GPMI_WRITE_DDR_DLL_CTRL)

GPMI DDR Write Delay Loop Lock Control Register. This register provides programmability in DDR mode for data output timing and data formats.

GPMI_WRITE_DDR_DLL_CTRL 0x110

Address: 180_6000h base + 110h offset = 180_6110h

GPMI Memory Map/Register Definition

GPMI_WRITE_DDR_DLL_CTRL field descriptions

Field	Description
31–28 REF_UPDATE_INT	This field allows the user to add additional delay cycles to the DLL control loop (reference delay line control). By default, the DLL control loop shall update every two GPMICLK cycles. Programming this field results in a DLL control loop update interval of $(2 + \text{REF_UPDATE_INT}) * \text{GPMICLK}$. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–20 SLV_UPDATE_INT	Setting a value greater than 0 in this field, shall over-ride the default slave delay-line update interval of 256 GPMICLK cycles. A value of 0 results in an update interval of 256 GPMICLK cycles (default setting). A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
19–18 RSVD1	Reserved
17–10 SLV_OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 256 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 256.
9 SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to tbe enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0
8 REFCLK_ON	set this bit to 1 will turn on the reference clock
7 GATE_UPDATE	Setting this bit to 1, forces the slave delay line not update
6–3 SLV_DLY_TARGET	The delay target for the read clock can be programmed in 1/16th increments of an GPMICLK half-period. So the input read-clock can be delayed relative input data from $(\text{GPMICLK}/2)/16$ to $\text{GPMICLK}/2$.
2 SLV_FORCE_UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered).
1 RESET	Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-calibrate to detect an GPMICLK half period phase shift. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again.
0 ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE VAL, the DLL does not need to be enabled.

30.6.19 GPMI Double Rate Read DLL Status Register Description (GPMI_READ_DDR_DLL_STS)

GPMI Double Rate Read DLL Status Register, Read Only. GPMI DLL status fields are provided in this register.

GPMI_READ_DDR_DLL_STS 0x120

Address: 180_6000h base + 120h offset = 180_6120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	RSVD1								REF_SEL								REF_LOCK
W	[Shaded]								[Shaded]								[Shaded]
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	RSVD0								SLV_SEL								SLV_LOCK
W	[Shaded]								[Shaded]								[Shaded]
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

GPMI_READ_DDR_DLL_STS field descriptions

Field	Description
31–25 RSVD1	Reserved
24–17 REF_SEL	Reference delay line select status.
16 REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to a half-phase GPMICKLK shift, allowing the slave delay-line to perform programmed clock delays.
15–9 RSVD0	Reserved
8–1 SLV_SEL	Slave delay line select status
0 SLV_LOCK	Slave delay-line lock status. This signifies that a valid calibration has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value.

30.6.20 GPMI Double Rate Write DLL Status Register Description (GPMI_WRITE_DDR_DLL_STS)

GPMI Double Rate Write DLL Status Register, Read Only. GPMI DLL status fields are provided in this register.

GPMI_WRITE_DDR_DLL_STS 0x130

Address: 180_6000h base + 130h offset = 180_6130h

GPMI_WRITE_DDR_DLL_STS field descriptions

Field	Description
31–25 RSVD1	Reserved
24–17 REF_SEL	Reference delay line select status.
16 REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to a half-phase GPMICLK shift, allowing the slave delay-line to perform programmed clock delays.
15–9 RSVD0	Reserved
8–1 SLV_SEL	Slave delay line select status
0 SLV_LOCK	Slave delay-line lock status. This signifies that a valid calibration has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value.

Chapter 31

General Purpose Timer (GPT)

31.1 Overview

This chapter describes the General Purpose Timer (GPT) module interface. It is also a reference for software driver programming. The GPT has a 32-bit up-counter. The timer counter value can be captured in a register using an event on an external pin. The capture trigger can be programmed to be a rising or/and falling edge. The GPT can also generate an event on the output compare pins and an interrupt when the timer reaches a programmed value. The GPT has a 12-bit prescaler, which provides a programmable clock frequency derived from multiple clock sources.

Figure 31-1. GPT Block Diagram

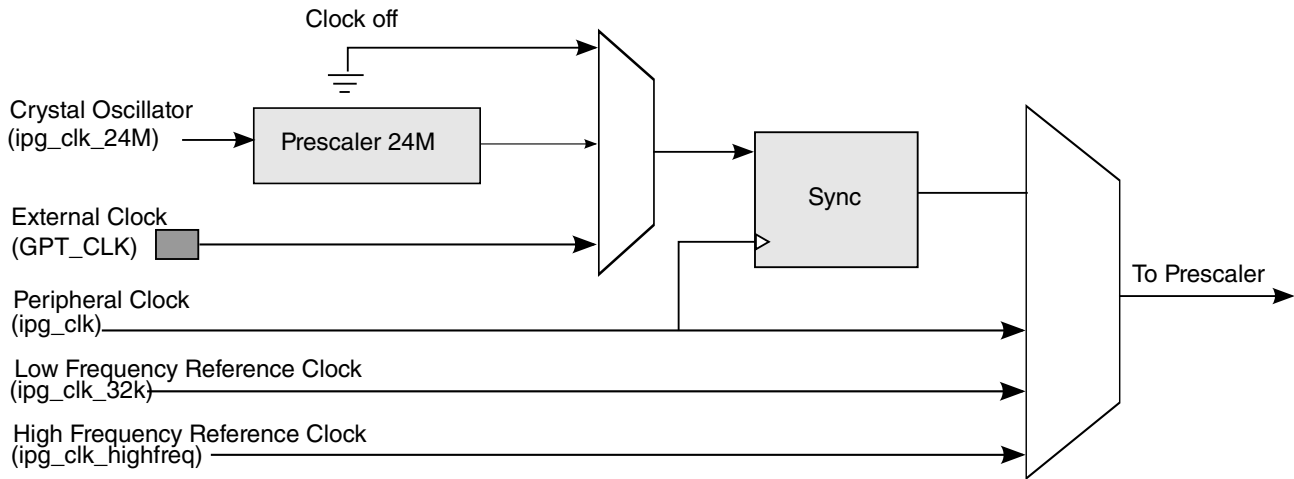

Figure 31-2. GPT Counter Clocks Diagram

31.1.1 Features

- One 32-bit up-counter with clock source selection, including external clock.
- Two input capture channels with a programmable trigger edge.
- Three output compare channels with a programmable output mode. A "forced compare" feature is also available.
- Can be programmed to be *active* in low power and debug modes.
- Interrupt generation at capture, compare, and rollover events.
- Restart or free-run modes for counter operations.

31.1.2 Modes and Operation

The GPT supports the modes described in the indicated sections:

- [Operating Modes](#)
 - [Restart Mode](#)
 - [Free-Run Mode](#)

31.2 External Signals

The GPT follows the IP Bus protocol for interfacing with the processor core. The GPT does not have *any interface signals with any other module inside the chip*, except for the clock and reset inputs (from the clock and reset controller module) and for the interrupt signals *to* the processor interrupt handler. There are functional and clock inputs, and functional output signals going outside the chip boundary.

The following table describes all block signals that connect off-chip.

Table 31-1. GPT External Signals

Signal	Description	Pad	Mode	Direction
GPT1_CLK	Input pin for an external clock that the counter can be operated at.	ENET1_TX_CLK	ALT8	I
		UART1_RX_DATA	ALT4	
GPT1_CAPTURE1	Input pin for a capture event for Input Capture Channel 1.	GPIO1_IO00	ALT1	I
		UART2_TX_DATA	ALT4	
GPT1_CAPTURE2	Input pin for a capture event for Input Capture Channel 2.	ENET1_RX_ER	ALT8	I
		UART2_RX_DATA	ALT4	
GPT1_COMPARE1	Output pin that indicates a "compare event" occurrence in Output Compare Channel 1.	GPIO1_IO01	ALT1	O
		UART1_TX_DATA	ALT4	
GPT1_COMPARE2	Output pin that indicates a "compare event" occurrence in Output Compare Channel 2.	GPIO1_IO02	ALT1	O
		UART2_CTS_B	ALT4	
GPT1_COMPARE3	Output pin that indicates a "compare event" occurrence in Output Compare Channel 3.	GPIO1_IO03	ALT1	O
		UART2_RTS_B	ALT4	
GPT2_CLK	Input pin for an external clock that the counter can be operated at.	JTAG_MODE	ALT1	I
		SD1_DATA1	ALT1	
GPT2_CAPTURE1	Input pin for a capture event for Input Capture Channel 1.	JTAG_TMS	ALT1	I
		SD1_DATA2	ALT1	
GPT2_CAPTURE2	Input pin for a capture event for Input Capture Channel 2.	JTAG_TDO	ALT1	I
		SD1_DATA3	ALT1	
GPT2_COMPARE1	Output pin that indicates a "compare event" occurrence in Output Compare Channel 1.	JTAG_TDI	ALT1	O
		SD1_CMD	ALT1	
GPT2_COMPARE2	Output pin that indicates a "compare event" occurrence in Output Compare Channel 2.	JTAG_TCK	ALT1	O
		SD1_CLK	ALT1	
GPT2_COMPARE3	Output pin that indicates a "compare event" occurrence in Output Compare Channel 3.	JTAG_TRST_B	ALT1	O
		SD1_DATA0	ALT1	

There are six signals (three input, three output) in the GPT module that *can be* connected to the chip pads.

31.2.1 External Clock Input

The GPT counter can be operated using an external clock from outside the device, and this is the input pin used for that purpose. The external clock input (GPT_CLK) is treated as asynchronous to the peripheral clock (ipg_clk). To ensure proper operations of GPT, the external clock input frequency should be less than 1/4 of frequency of the peripheral clock (ipg_clk). Hysteresis characteristics on this pad will be required because this is a clock input.

31.2.2 Input Capture Trigger Signals

The GPT counter value can be stored in a register, triggered by an event from *outside the device*. A positive or/and negative edge on these signals GPT_CAPTURE1 , GPT_CAPTURE2 can trigger this capture event. These signals are treated as asynchronous to the peripheral clock (ipg_clk). Only those transitions which occur *at least a single clock cycle* (the clock selected to run the counter) *after the previous recorded transition* are guaranteed to trigger a capture event.

31.2.3 Output Compare Signals

The output compare signals: GPT_COMPARE1, GPT_COMPARE2, GPT_COMPARE3, indicate that output compare events have gone through a specified transition.

31.3 Clocks

The clock that is input to the prescaler can be selected from 4 clock sources. The following table describes the clock sources for GPT. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 31-2. GPT Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32 kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

- High-Frequency Clock (ipg_clk_highfreq)

Provided by the Clock Controller Module (CCM), the High Frequency Clock is intended to be ON in Normal Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the High Frequency Clock *in Normal Power mode*. The CCM is expected to provide this clock *after* synchronizing it to the System Bus Clock (ahb_clk) in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the High Frequency Clock in a Low Power mode.

- Low-Reference Clock (ipg_clk_32k)

This 32 kHz Low Reference Clock (provided by the CCM) is intended to be ON in Low Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the Low Reference Clock in Low Power mode. The CCM is expected to provide the Low Reference Clock *after* synchronizing it to the System Bus Clock (ahb_clk) in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the Low Reference Clock in a Low Power mode.

- Peripheral Clock (ipg_clk)

If the Peripheral Clock (ipg_clk) or the External Clock (GPT_CLK) is selected (CLKSRC=001 or 011) as Clock Source, then the Peripheral Clock will be ON in normal GPT operations. In Low Power modes, if the GPT is programmed to be disabled (STOPEN or WAITEN or DOZEN=0), then the Peripheral Clock (ipg_clk) can be switched OFF.

- External Clock (GPT_CLK)

The External Clock comes from *outside the device* and can be selected to run the GPT counter. The External Clock is treated as *asynchronous to the Peripheral Clock*, (ipg_clk) and is synchronized to the Peripheral Clock (ipg_clk), *inside* the module. Therefore, the External Clock frequency is limited to < 1/4 frequency of the Peripheral Clock (ipg_clk), for proper GPT operations. Note that in Low Power modes, *if* the Peripheral Clock (ipg_clk) is not available, then the External Clock *cannot be used* to run the counter.

- Crystal Oscillator Clock (ipg_clk_24M)

This 24 MHz Crystal Oscillator Clock (provided by the CCM) is intended to be used against frequency change of Peripheral Clock (ipg_clk) changes to provide a more accurate timer clock for operation system. The CCM is expected to provide the 24 MHz Crystal Oscillator Clock *without* synchronizing it to the System Bus Clock (ahb_clk) in Normal functional mode. Synchronization is done in GPT module.

Before synchronization, the 24 MHz Crystal Oscillator Clock is divided by a 24 MHz clock prescaler, to make sure the clock frequency less than half of System Bus Clock (ahb_clk).

The clock input source is configured using the clock source field (CLKSRC, in the GPT_CR control register). The clock input to the prescaler can be disabled by programming the CLKSRC bits (of the GPT_CR control register) to 000. **The CLKSRC field value should be changed only after disabling the GPT** (by setting the EN bit in the GPT_CR to 0).

The PRESCALER field selects the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value (from 1 to 4096) and can be changed *at any time*. A change in the value of the PRESCALER field *immediately affects* the output clock frequency.

Figure 31-3. Prescaler Value Change Timing Diagram

31.4 Functional Description

This section provides a complete functional description of the GPT.

31.4.1 Operating Modes

The GPT counter can be programmed to work in either of two modes: Restart mode or Free-Run mode.

31.4.1.1 Restart Mode

In Restart mode (selectable through the GPT Control Register GPT_CR), when the counter reaches the compared value, the counter resets and starts again from 0x00000000. The Restart feature is associated only with Compare Channel 1.

Any write access to the Compare register of Channel 1 will reset the GPT counter. This is done to avoid possibly missing a compare event when compare value is changed from a higher value to lower value while counting is proceeding.

For the other two compare channels, when the compare event occurs the counter is *not reset*.

31.4.1.2 Free-Run Mode

In Free-Run mode, when compare events occur for all 3 channels, the counter is *not reset*; instead the counter continues to count until 0xffffffff, and then rolls over (to 0x00000000).

31.4.2 Operation

The General Purpose Timer (GPT) has a single counter (GPT_CNT) that is a 32-bit free-running *up-counter*, which starts counting *after it is enabled by software* (EN=1). The counter's clock source is the output of the prescaler labelled "Prescaler output" in [Figure 31-1](#).

- If the GPT timer is disabled (EN=0), then the Main Counter *and* Prescaler Counter freeze their current count values. The ENMOD bit determines the value of the GPT counter when the EN bit is set and the Counter is enabled again.
 - If the ENMOD bit is set (=1), then the Main Counter and Prescaler Counter values are reset to 0, when GPT is enabled (EN=1).
 - If ENMOD bit is programmed to 0, then the Main Counter and Prescaler Counter restart counting from their frozen values, when GPT is enabled again (EN=1).
- If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter freeze at their current count values *when* GPT enters low power mode. When GPT exits a low power mode, the Main Counter and Prescaler Counter start counting from their frozen values *regardless* of the ENMOD bit value. Note that the GPT_CNT can be read *at any time* by the processor, and that *both* Input Capture Channels use the *same* counter (GPT_CNT).

- A hardware reset resets all the GPT registers to their respective reset values. All registers except the Output Compare Registers (OCR1, OCR2, OCR3) obtain a value of 0x0. The Compare registers are reset to 0xFFFF_FFFF.
- The software reset (SWR bit in the GPT_CR control register) resets *all* of the register bits *except* the EN, ENMOD, STOPEN, WAITEN, and DBGEN bits. The state of these bits is not affected by a software reset. Note that a software reset can be given *while the GPT is disabled*.

31.4.2.1 Input Capture

There are two Input Capture Channels, and each Input Capture Channel has a dedicated capture pin, capture register and input edge detection/selection logic. Each input capture function has an associated status flag, and can cause the processor to make an interrupt service request.

When a selected edge transition occurs on an Input Capture pin, the contents of the GPT_CNT is captured on the corresponding capture register and the appropriate interrupt status flag is set. An interrupt request can be generated when the transition is detected *if* its corresponding enable bit is set (in the Interrupt Register). The capture can be programmed to occur on the input pin's rising edge, falling edge, on both rising and falling edges, or the capture can be disabled. The events are synchronized with the clock that was selected to run the counter. Only those transitions that occur at least one clock cycle (clock selected to run the counter) *after* the previous recorded transition will be guaranteed to trigger a capture event. There can be up to one clock cycle of uncertainty in the latching of the input transition. The Input Capture registers can be read *at any time* without affecting their values.

Figure 31-4. Input Capture Event Timing

31.4.2.2 Output Compare

The three Output Compare Channels *use the same counter* (GPT_CNT) as the Input Capture Channels. When the programmed content of an Output Compare register matches the value in GPT_CNT, an output compare status flag is set and an interrupt is generated (if the corresponding bit is set in the interrupt register). Consequently, the Output Compare timer pin will be set, cleared, toggled, not affected at all or provide an active-low pulse for one input clock period (subject to the restriction on the maximum frequency allowed on the pad) according to the mode bits (that were programmed).

There is also a "forced-compare" feature that allows the software to generate a compare event when required, *without the condition of the counter value that is equal to the compare value*. The action taken as a result of a forced compare is the same as when an output compare match occurs, *except that the status flags are not set and no interrupt can be generated*. Forced channels take programmed action immediately after the write to the force-compare bits. These bits are self-negating and always read as zeros.

Figure 31-5. Output Compare and Interrupt Timing

31.4.2.3 Interrupts

There are 6 different interrupts that are generated by the GPT. If the selected clock for running the counter is available, then *all interrupts can be generated in Low Power and Debug modes*.

- Rollover Interrupt

The Rollover Interrupt is generated when the GPT counter reaches 0xffffffff, then resets to 0x00000000 and continues counting. The Rollover Interrupt is enabled by the ROVIE bit in the GPT_IR register; the associated status bit is the ROV bit in the GPT_SR register.

- Input Capture Interrupt 1, 2

After a capture event occurs, the associated Input Capture Channel generates an interrupt. The "capture event" interrupts are enabled by the IF2IE and IF1IE bits (in the GPT_IR register); the associated status bits are IF2 and IF1 (in the GPT_SR register). The capture of the counter value because of a capture event is *not affected by a pending capture interrupt*. The Capture register is updated with a new counter value when a capture event occurs, regardless of whether that Capture Channels' interrupt has been serviced or not.

- Output Compare Interrupt 1, 2, 3

After a compare event occurs, the associated Output Compare Channel generates an interrupt. The "compare event" interrupts are enabled by the OF3IE, OF2IE, and OF1IE bits (in the GPT_IR register); the associated status bits are OF3, OF2, and OF1 (in the GPT_SR register). A "forced compare" does not generate an interrupt.

A *cumulative* interrupt line is also present, which is asserted whenever any of the above interrupts are posted. The cumulative interrupt line has *no* associated enables or status bits.

31.4.2.4 Low Power Mode Behavior

In Low Power modes, if the clock from the selected clock source is available (except for the External Clock (GPT_CLK), which can be used *only if* the Peripheral Clock (ipg_clk) is available), the counter will continue to run depending on whether the control bit for that mode is set. If the clock is not present or if the corresponding low power bit in the GPT_CR control register is 0, the Main Counter and the Prescaler Counter freeze at their current values and resume counting (from their frozen values) when the Low Power mode is exited.

31.4.2.5 Debug Mode Behavior

In Debug mode, the modules in the device have the option of continuing to run or be halted.

- If the DBGEN bit is set, then the GPT timer will continue to run in Debug mode.
- If the DBGEN bit is not set (in the GPT_CR control register), then the GPT timer is halted.

31.5 Initialization/ Application Information

31.5.1 Selecting the Clock Source

The CLKSRC field in the GPT_CR register selects the clock source. The CLKSRC field value should be changed only after disabling the GPT (EN=0).

The software sequence to be followed while changing clock source is:

1. Disable GPT by setting EN=0 in GPT_CR register.
2. Disable GPT interrupt register (GPT_IR).
3. Configure Output Mode to unconnected/ disconnected—Write zeros in OM3, OM2, and OM1 in GPT_CR
4. Disable Input Capture Modes—Write zeros in IM1 and IM2 in GPT_CR
5. Change clock source CLKSRC to the desired value in GPT_CR register.
6. Assert the SWR bit in GPT_CR register.
7. Clear GPT status register (GPT_SR) (i.e., w1c).
8. Set ENMOD=1 in GPT_CR register, to bring GPT counter to 0x00000000.
9. Enable GPT (EN=1) in GPT_CR register.
10. Enable GPT interrupt register (GPT_IR).

31.6 GPT Memory Map/Register Definition

The GPT has 10 user-accessible 32-bit registers, which are used to configure, operate, and monitor the state of the GPT.

An IP bus write access to the GPT Control Register (GPT_CR) and the GPT Output Compare Register1 (GPT_OCR1) results in *one cycle of wait state*, while other valid IP bus accesses incur 0 wait states.

Irrespective of the Response Select signal value, a Write access to the GPT Status Registers (Read-only registers GPT_ICR1, GPT_ICR2, GPT_CNT) will generate a bus exception.

- If the Response Select signal is driven Low, then the Read/Write access to the *unimplemented* address space of GPT (*ips_addr* is greater than or equal to \$BASE + \$028) will generate a bus exception.
- If the Response Select is driven High, then the Read/Write access to the unimplemented address space of GPT will *not* generate any error response (like a bus exception).

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 1.

31.6.6 GPT Output Compare Register 2 (GPTx_OCR2)

The GPT Compare Register 2 (GPT_OCR2) holds the value that determines when a compare event will be generated on Output Compare Channel 2.

Address: Base address + 14h offset

GPTx_OCR2 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 2.

31.6.7 GPT Output Compare Register 3 (GPTx_OCR3)

The GPT Compare Register 3 (GPT_OCR3) holds the value that determines when a compare event will be generated on Output Compare Channel 3.

Address: Base address + 18h offset

GPTx_OCR3 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 3.

31.6.8 GPT Input Capture Register 1 (GPTx_ICR1)

The GPT Input Capture Register 1 (GPT_ICR1) is a read-only register that holds the value *that was in the counter during the last capture event* on Input Capture Channel 1.

Address: Base address + 1Ch offset

GPTx_ICR1 field descriptions

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 1 occurs, the current value of the counter is loaded into GPT Input Capture Register 1.

31.6.9 GPT Input Capture Register 2 (GPTx_ICR2)

The GPT Input capture Register 2 (GPT_ICR2) is a read-only register which holds the value that was in the counter during the last capture event on input capture channel 2.

Address: Base address + 20h offset

GPTx_ICR2 field descriptions

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 2 occurs, the current value of the counter is loaded into GPT Input Capture Register 2.

31.6.10 GPT Counter Register (GPTx_CNT)

The GPT Counter Register (GPT_CNT) is the main counter's register. GPT_CNT is a read-only register and can be read *without affecting the counting process* of the GPT.

Address: Base address + 24h offset

GPTx_CNT field descriptions

Field	Description
COUNT	Counter Value. The COUNT bits show the current count value of the GPT counter.

Chapter 32

I2C Controller (I2C)

32.1 Overview

This chapter describes block-level operation and programming of I2C. The chapter is intended for a block-driver software developer. To understand how the block is integrated at the SoC level, a system software developer should see discussions of the block in the appropriate SoC-level chapter(s).

References: This document assumes an understanding of the following document:

- *The I2C Bus Specification, Version 2.1*, by Philips Semiconductor

The Inter IC (I2C) provides functionality of a standard I2C slave and master. The I2C is designed to be compatible with the standard NXP I2C bus protocol.

NOTE

independent I2C channels are available.

I2C is a two-wire, bidirectional serial bus that provides a simple, efficient method of data exchange, minimizing the interconnection between devices. This bus is suitable for applications requiring occasional communications over a short distance between many devices. The flexible I2C standard allows additional devices to be connected to the bus for expansion and system development. See the connection diagram in the figure below.

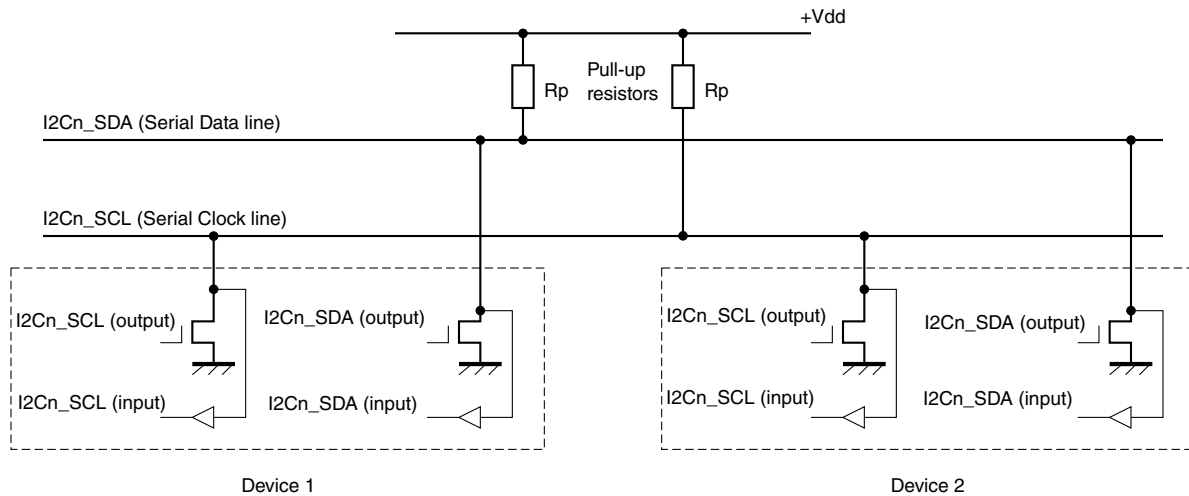

Figure 32-1. Connection of devices to I2C bus

The I2C interface speed is dependent on the I2C bus loading and timing characteristics. For pin requirement details, see *The I2C Bus Specification*. The I2C system is a true multimaster bus including arbitration and collision detection that prevents data corruption if multiple devices attempt to control the bus simultaneously. This feature supports complex applications with multiprocessor control and can be used for rapid testing and alignment of end products through external connections to an assembly-line computer. The figure below shows the block diagram of I2C.

Figure 32-2. I2C block diagram

32.1.1 Features

The I2C has the following key features:

- Compatibility with I2C bus standard
- Multimaster operation
- Software programmability for one of 64 different serial clock frequencies
- Software-selectable acknowledge bit
- Interrupt-driven, byte-by-byte data transfer
- Arbitration-lost interrupt with automatic mode switching from master to slave

- Calling address identification interrupt
- Start and stop signal generation/detection
- Repeated Start signal generation
- Acknowledge bit generation/detection
- Bus-busy detection

32.1.2 Modes and operations

The I2C operates primarily in two functional modes: Standard mode and Fast mode.

- In Standard mode, I2C supports the data transfer rates up to 100 kbits/s.
- In Fast mode, data transfer rates up to 400 kbits/s can be achieved. Per block operation, there is no special configuration required for Fast or Standard mode. It is the data transfer rate that distinguishes Standard and Fast mode.

32.2 External Signals

This section discusses I2C signals that connect off-chip.

For I2C compliance, all devices connected to the I2Cn_SCL and I2Cn_SDA signals must have open-drain or open-collector outputs. The logic AND function is implemented on both lines with external pull-up resistors.

Inputs of I2Cn_SCL and I2Cn_SDA also need to be manually enabled by setting the SION bit in the IOMUX after the corresponding PADs are selected as I2C function.

The table below describes all I2C signals that connect off-chip.

Table 32-1. I2C External Signals

Signal	Description	Pad	Mode	Direction
I2C1_SCL	Serial Clock	CSI_PIXCLK	ALT3	IO
		GPIO1_IO02	ALT0	
		UART4_TX_DATA	ALT2	
I2C1_SDA	Serial Data	CSI_MCLK	ALT3	IO
		GPIO1_IO03	ALT0	
		UART4_RX_DATA	ALT2	
I2C2_SCL	Serial Clock	CSI_HSYNC	ALT3	IO
		GPIO1_IO00	ALT0	
		UART5_TX_DATA	ALT2	
I2C2_SDA	Serial Data	CSI_VSYNC	ALT3	IO

Table continues on the next page...

Table 32-1. I2C External Signals (continued)

Signal	Description	Pad	Mode	Direction
		GPIO1_IO01	ALT0	
		UART5_RX_DATA	ALT2	
I2C3_SCL	Serial Clock	ENET2_RX_DATA0	ALT3	IO
		LCD_DATA01	ALT4	
		UART1_TX_DATA	ALT2	
I2C3_SDA	Serial Data	ENET2_RX_DATA1	ALT3	IO
		LCD_DATA00	ALT4	
		UART1_RX_DATA	ALT2	
I2C4_SCL	Serial Clock	ENET2_RX_EN	ALT3	IO
		LCD_DATA03	ALT4	
		UART2_TX_DATA	ALT2	
I2C4_SDA	Serial Data	ENET2_TX_DATA0	ALT3	IO
		LCD_DATA02	ALT4	
		UART2_RX_DATA	ALT2	

32.3 Clocks

There are two input clocks for I2C.

The following table describes the clock sources for I2C. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 32-2. I2C Clocks

Clock name	Clock Root	Description
ipg_clk_patref	perclk_clk_root	Module clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

- Peripheral clock: This clock is used for peripheral bus register read/writes.
- Module clock: This is the functional clock of the I2C. The serial bit clock frequency is derived from the module clock. The module clock and peripheral clocks are synchronous with each other. The minimum frequency of the module clock should be 12.8 MHz for Fast mode to achieve 400-kbps operation.

32.4 Functional description

This section provides a complete functional description of the block.

32.4.1 I2C system configuration

After a reset, the I2C defaults to Slave Receive operations. Thus, when not operating as a master or responding to a slave transmit address, the I2C defaults to the Slave Receive state.

For exceptions, see [Initialization sequence](#).

NOTE

The I2C is designed to be compatible with the Philips™ I2C bus protocol. For information on system configuration, protocol, and restrictions, see the *I2C Bus Specification*, version 2.1, by Philips Semiconductors. The I2C supports Standard and Fast modes only.

32.4.2 Arbitration procedure

If multiple devices simultaneously request the bus, the bus clock is determined by a synchronization procedure in which the low period equals the longest clock-low period among the devices, and the high period equals the shortest. A data arbitration procedure determines the relative priority of competing devices.

A device loses arbitration if it sends logic high while another sends logic low; it immediately switches to Slave Receive mode and stops driving I2Cn_SDA. In this case, the transition from master to Slave mode does not generate a Stop condition. Meanwhile, hardware sets the arbitration lost bit in the I2C Status register (I2C_I2SR[IAL] to indicate loss of arbitration).

32.4.3 Clock synchronization

Because wire-AND logic is used, a high-to-low transition on SCL affects devices connected to the bus. Devices start counting their low period when the master drives SCL low. When a device clock goes low, it holds SCL low until the Clock High state is reached. However, the low-to-high change in this device clock may not change the state of SCL if another device clock is still in its low period. Therefore, the device with the longest low period holds the synchronized clock SCL low.

Devices with shorter low periods enter a High Wait state during this time (see [Figure 32-3](#)). When all devices involved have counted off their low periods, the synchronized clock SCL is released and pulled high. There is then no difference between device clocks and the state of SCL, so all of the devices start counting their high periods. The first device to complete its high period pulls SCL low again.

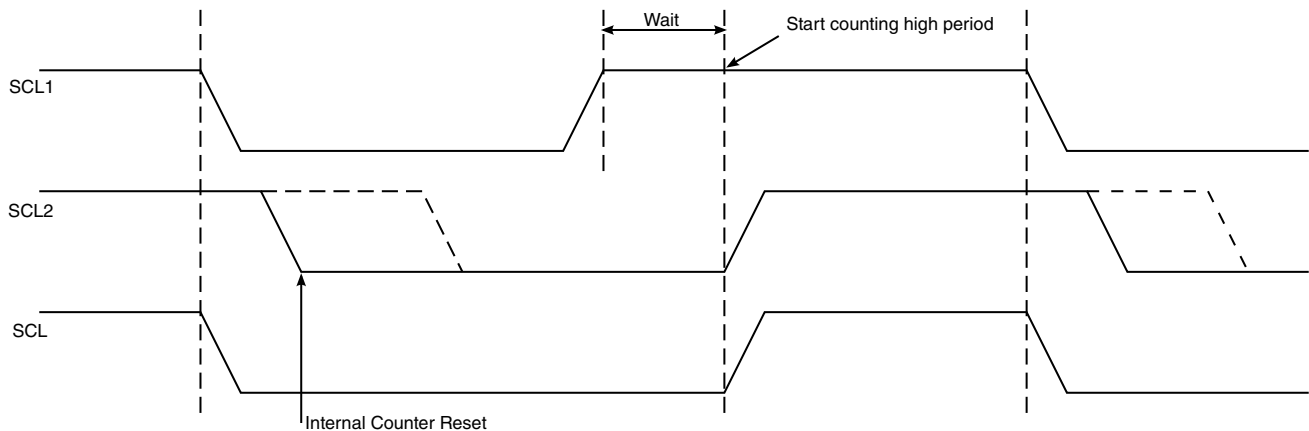

Figure 32-3. Synchronized clock SCL

32.4.4 Handshaking

The clock synchronization mechanism can be used as a handshake in data transfers. Slave devices can hold SCL low after completing one byte transfer (9 bits). In such a case, the clock mechanism halts the bus clock and forces the master clock into a Wait state until the slave releases SCL.

32.4.5 Clock stretching

Slaves can use the clock synchronization mechanism to slow down the transfer bit rate. After the master has driven SCL low, the slave can drive SCL low for the required period and then release it. If the slave SCL low period is longer than the master SCL low period, the resulting SCL bus signal low period is stretched.

32.4.6 Peripheral bus accesses

I2C is a 16-bit block. Only half-word accesses should be performed to the block.

32.4.7 Generation of transfer error on IP bus

If an address is received on the peripheral slave bus interface but it is not implemented, an access error is generated.

32.4.8 Reset

The I2C can be reset in the following ways:

- Global reset: A hard asynchronous reset of the whole I2C
- Software reset: An internal reset for the whole I2C (except for I2C_IADR and I2C_IFDR registers) initiated by deasserting the I2C_I2CR[IEN] bit

32.4.9 Interrupts

There is only one interrupt from the block, which is enabled by setting the I2C_I2CR[IIEN] bit.

The interrupt is generated in any one of the following conditions:

- One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).
- An address is received that matches its own specific address in Slave Receive mode.
- Arbitration is lost.

32.4.10 Byte order

The block only supports the Little-Endian mode.

32.5 Initialization

NOTE

Ensure the input select pins for IOMUXC are configured correctly for I2C.

32.5.1 Initialization sequence

Before the interface can transfer serial data, registers must be initialized, as listed here.

1. Set the data sampling rate (I2C_IFDR[IC]) to obtain SCL frequency from the system bus clock.
2. Update the address in the (I2C_IADR) to define its slave address (address can range from 0 to 0x7f).
3. Set the I2C enable bit (I2C_I2CR[IEN]) to enable the I2C bus interface system.
4. Modify the bits in the I2C_I2CR to select Master/Slave mode, Transmit/Receive mode, and Interrupt-Enable or not.

32.5.2 Generation of Start

After completion of the initialization procedure, serial data can be transmitted by selecting the Master Transmit mode. On a multimaster bus system, the busy bus (I2C_I2SR[IBB]) must be tested to determine whether the serial bus is free. If the bus is free (IBB = 0), the Start signal and the first byte (the slave address) can be sent. The data written to the data register comprises the address of the desired slave and the LSB indicates the transfer direction.

The free time between a Stop and the next Start condition is built into the hardware that generates the Start cycle. Depending on the relative frequencies of the system clock and the SCL period, it may be necessary to wait until the I2C is not busy after writing the calling address to the data register (I2C_I2DR), before proceeding to load data into the data register (I2C_I2DR).

32.5.3 Post-transfer software response

Sending or receiving a byte sets the data transferring bit (I2C_I2SR[ICF]), which indicates one byte of communication is finished. Upon completion, the interrupt status (I2C_I2SR[IIF]) is also set. An external interrupt is generated if the interrupt enable (I2C_I2CR[IIEN]) is set. The software must first clear the interrupt status (I2C_I2SR[IIF]) in the interrupt routine.

See the flow chart in [Figure 32-5](#).

The data transferring bit (I2C_I2SR[ICF]) is cleared either by reading from I2C_I2DR in Receive mode or by writing to this register in Transmit mode.

The software can service the I2C I/O in the main program by monitoring the interrupt status (I2C_I2SR[IIF]) if the interrupt enable is deasserted. In this case, the interrupt status should be polled in the data transferring bit (I2C_I2SR[ICF]) because the operation is different when arbitration is lost.

When an interrupt occurs at the end of the address cycle, the master is always in Transmit mode; that is, the address is sent. If Master Receive mode is required, then I2C_I2CR[MTX] should be toggled and a dummy read of the I2C_I2DR register must be executed to trigger receive data.

During Slave-mode address cycles (I2C_I2SR[IAAS] = 1), the slave read/write bit I2C_I2SR[SRW] is read to determine the direction of the next transfer. The transmit/receive bit (I2C_I2CR[MTX]) should also be programmed accordingly. For Slave-mode data cycles (IAAS = 0), SRW is invalid. MTX should be read to determine the current transfer direction.

32.5.4 Generation of Stop

A data transfer ends when the master signals a Stop, which can occur after all data is sent.

For a master receiver to terminate a data transfer, it must inform the slave transmitter by not acknowledging the last data byte. This is done by setting the transmit acknowledge bit (I2C_I2CR[TXAK]) before reading the next-to-last byte. Before the last byte is read, a Stop signal must be generated.

32.5.5 Generation of Repeated Start

After the data transfer, if the master still requires the bus, it can signal another Start followed by another slave address without signaling a Stop.

32.5.6 Slave mode

In the slave interrupt service routine (see [Figure 32-5](#)), the block addressed as slave bit (IAAS) should be tested to check if a calling of its own address has just been received. If IAAS is set, software should set the Transmit/Receive mode select bit (I2C_I2CR[MTX]) according to the I2C_I2SR[SRW]. Writing to the I2C_I2CR clears the IAAS automatically. The only time IAAS is read as set is from the interrupt at the end of the address cycle where an address match occurred; interrupts resulting from subsequent data transfers will have IAAS cleared. A data transfer can now be initiated by writing information to I2C_I2DR for slave transmits, or read from I2C_I2DR in Slave Receive mode. A dummy read of I2C_I2DR in Slave Receive mode releases SCL, allowing the master to send data.

In the slave transmitter routine, the receive acknowledge bit (I2C_I2SR[RXAK]) must be tested before sending the next byte of data. Setting RXAK means an end-of-data signal from the master receiver, after which the software must switch it from Transmit to Receiver mode. Reading the data register (I2C_I2DR) then releases SCL so the master can generate a Stop signal.

32.5.7 Arbitration lost

If several devices try to engage the bus at the same time, one becomes master. Hardware immediately switches devices that lose arbitration to Slave Receive mode. Data output to 12Cn_SDA stops, but 12Cn_SCL is still generated until the end of the byte during which arbitration is lost. An interrupt occurs at the falling edge of the ninth clock of this transfer if the arbitration is lost (I2C_I2SR[IAL] = 1), and the Slave mode is selected (I2C_I2CR[MSTA] = 0).

See the flow chart in [Figure 32-5](#).

If a device that is not a master tries to transmit or do a Start, hardware inhibits the transmission, clears MSTA without signaling a Stop, generates an interrupt to the ARM platform, and sets I2C_I2SR[IAL] to indicate a failed attempt to engage the bus. When considering these cases, the slave service routine should first test I2C_I2SR[IAL], and the software should clear it if it is set.

For Multimaster mode, when an I2C is enabled when the bus is busy and asserts Start, the I2C_I2SR[IAL] bit gets set only for 12Cn_SDA=0, 12Cn_SCL=0/1, 12Cn_SDA=1, and 12Cn_SCL=0; but not for 12Cn_SDA=1 and I2Cn_SCL=1, which is the equivalent of Bus Idle state.

Figure 32-4. I2C Programming state diagram

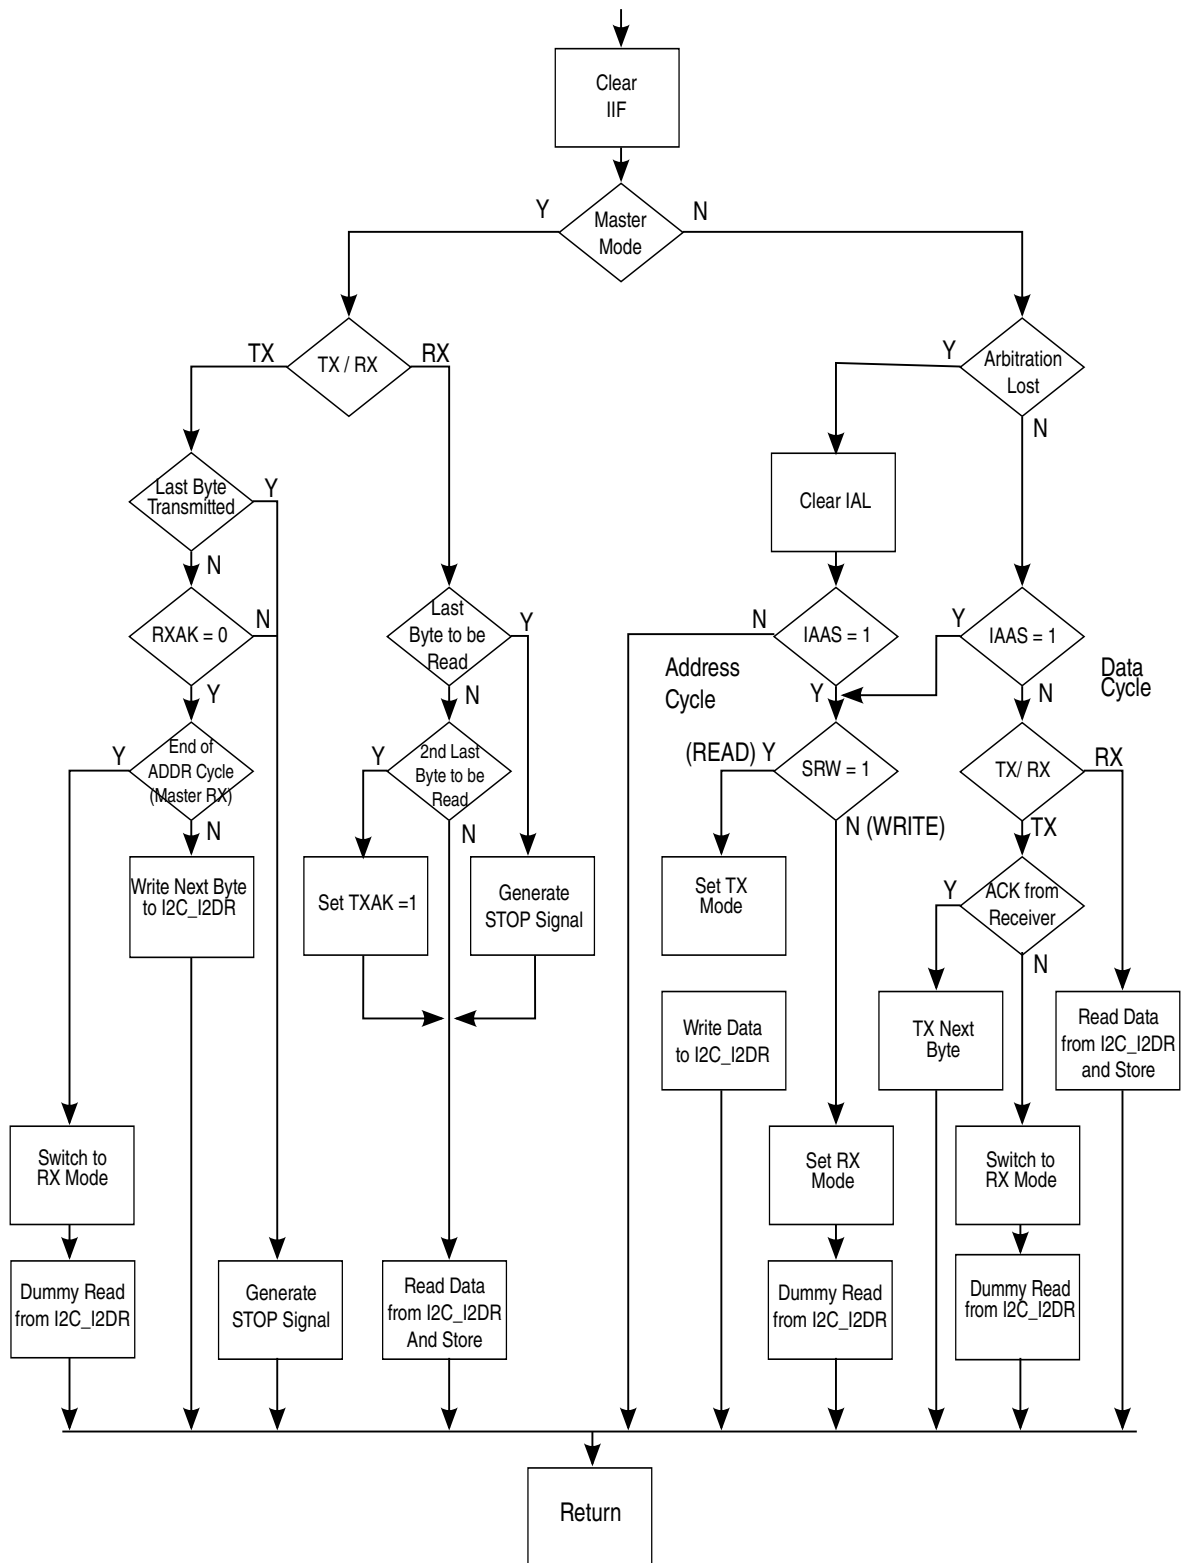

Figure 32-5. Flowchart of typical I2C interrupt routine

NOTE

For a Repeated Start only, the Stop-generation stage does not occur in Master mode. A loop repeats itself without stopping for the next start.

For Master Receive mode, I2C is programmed as Master Transmit during Address mode and after slave address transfer; the MTX bit should be cleared and a dummy read on the I2C_I2DR register should be performed so I2C can read the next receive data.

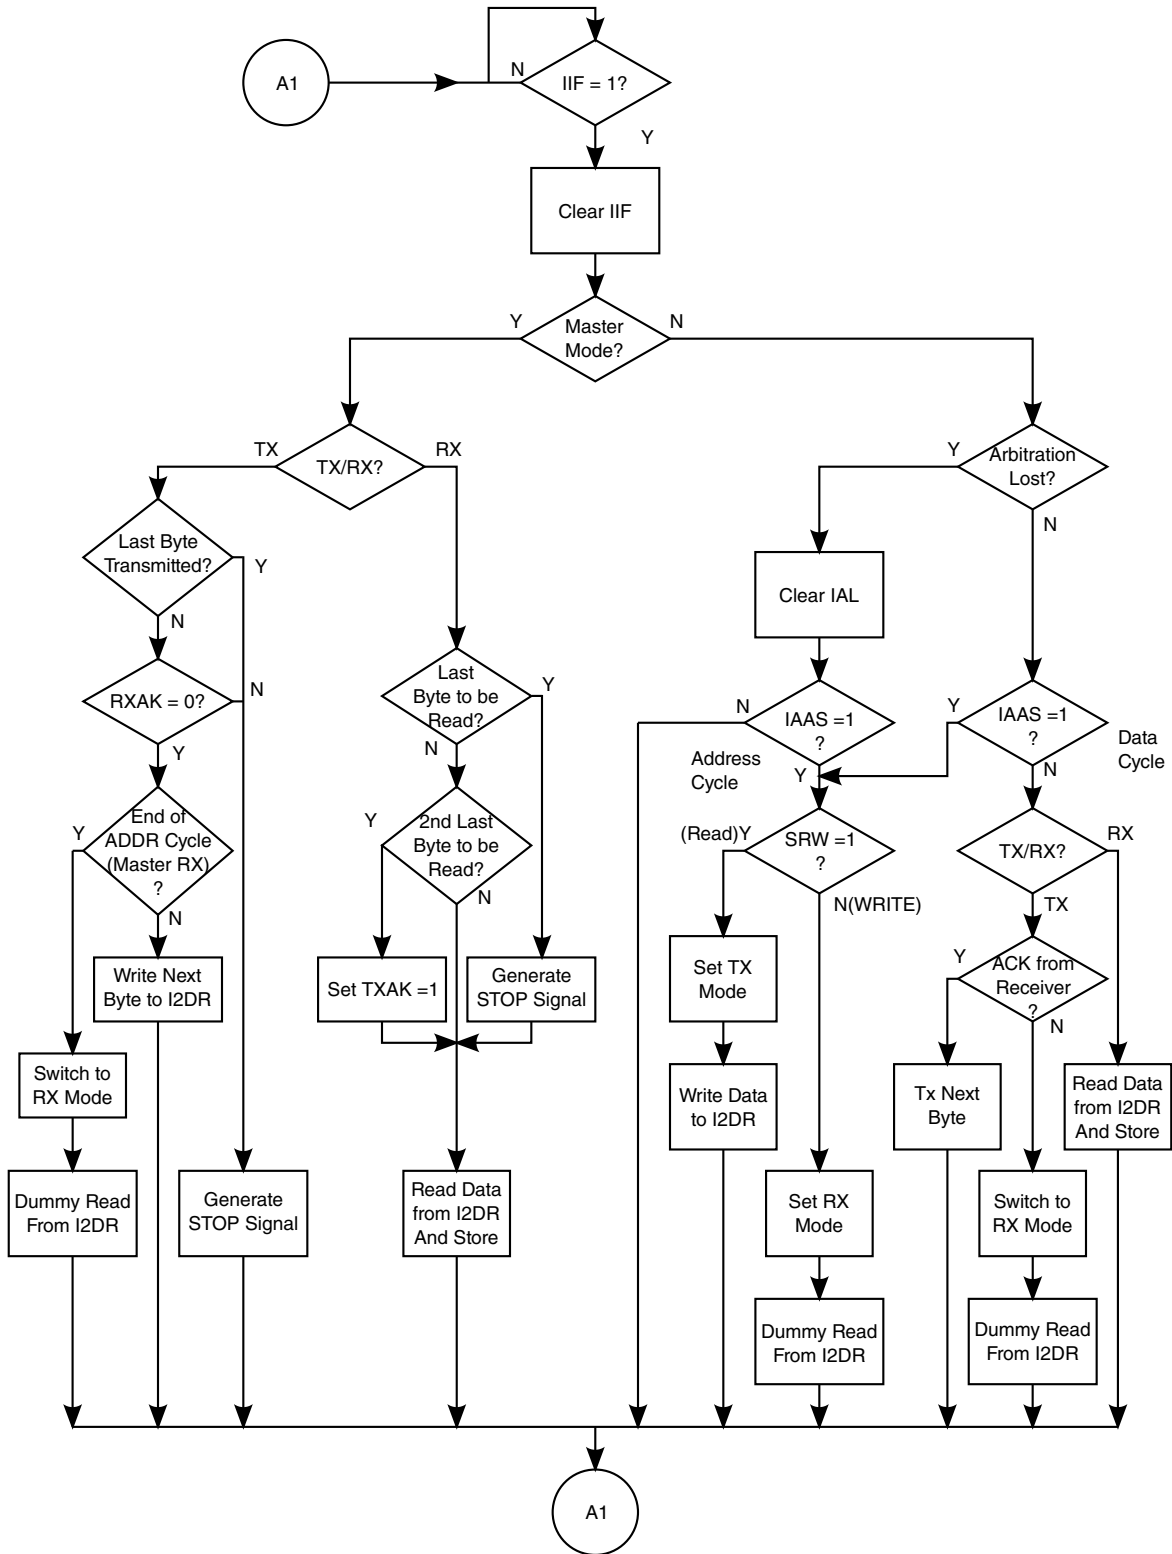

Figure 32-6. Flowchart for typical I2C polling routine

NOTE

The timeout value depends on the bus frequency at which I2C is operating. The minimum timeout for polling the IIF bit at a maximum I2C bus frequency of 400 kHz is $T_{min} = 25 \mu s$ ($=2.5 \times 10 \mu s$). This value can be calculated for any bus frequency. The formula is $T_{min} = 10/F_{SCL}$, where F_{SCL} is the frequency of the I2C clock (SCL).

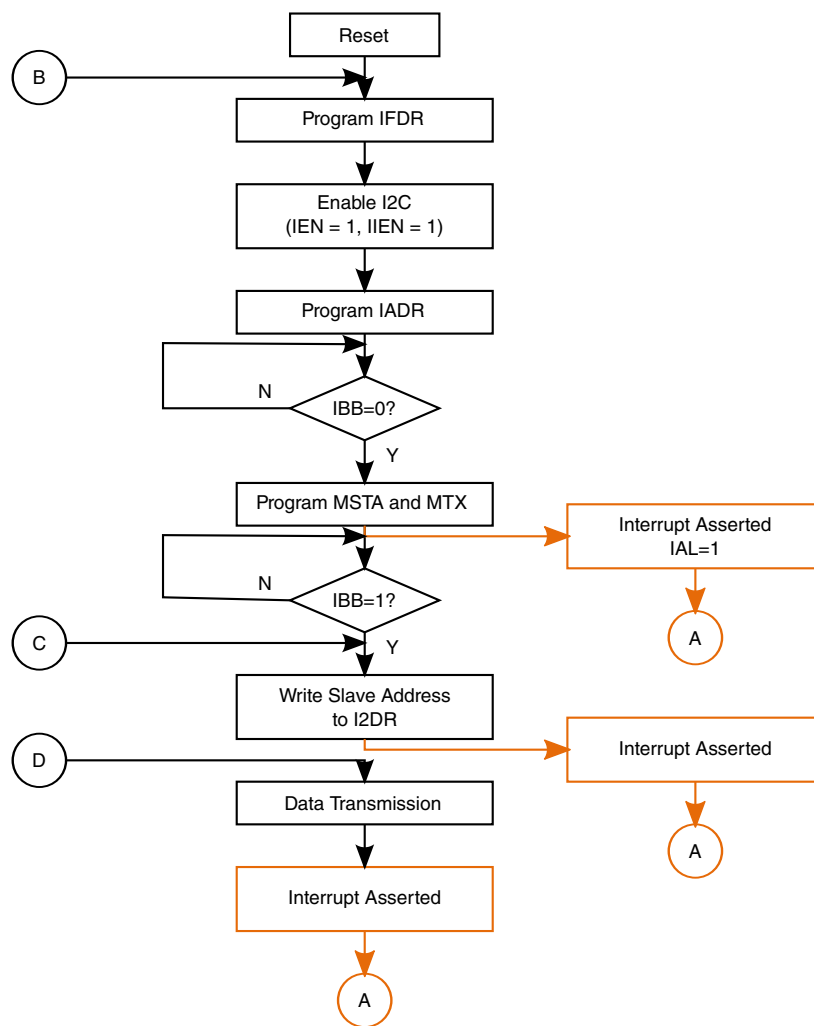

Figure 32-7. Detailed flowchart of a typical I2C Master Transmit mode, part 1

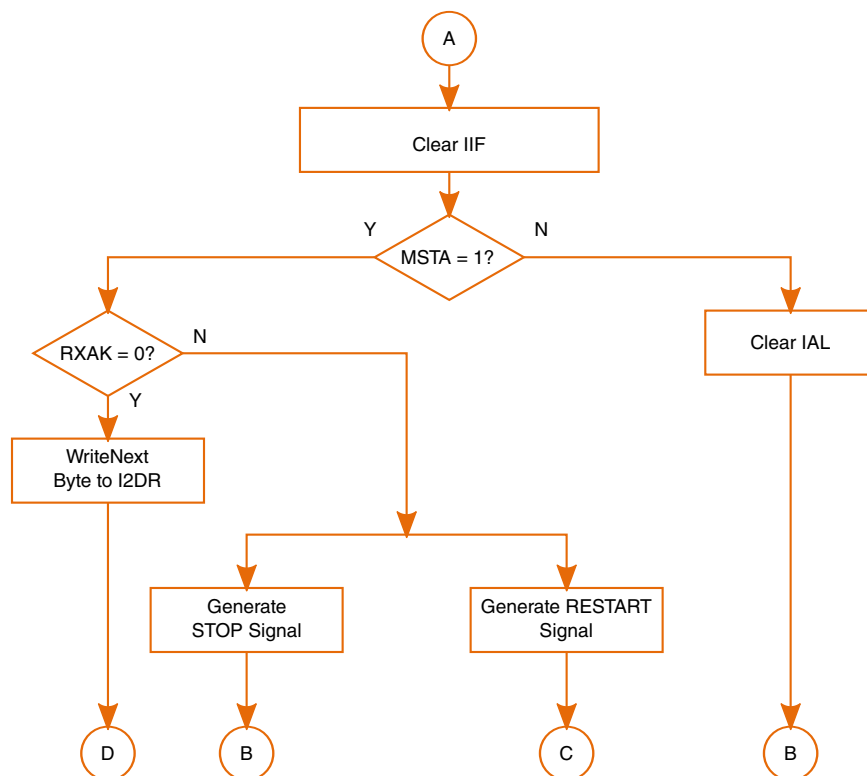

Figure 32-8. Detailed flowchart of a typical I2C Master Transmit mode, part 2

Figure 32-7 and Figure 32-8 show the Master Transmit mode operation with interrupt subroutine. If an interrupt is generated and the MSTA bit is 0, then bus arbitration is lost and IAL is set. Software can clear the IAL bit and reprogram I2C. If the MSTA bit is 1, then it is a transfer-generated interrupt. In this case, software can check the RXAK bit for a data receive acknowledgement by the slave and, accordingly, decide to do one of the following:

- Generate a STOP
- Generate a REPEATED START by writing to the I2C_I2CR register
- Perform the next data transfer by writing to the I2C_I2DR register

NOTE

The IBB bit is asserted by a Start condition on the bus, and it is deasserted by a Stop condition on the bus. Therefore, if arbitration is lost due to an unexpected Stop condition during transfer, then IBB is cleared. If arbitration is lost due to a data mismatch, then it is not cleared. Software should always clear the IEN bit and then set it if arbitration is lost.

32.6 Software restriction

Software should ensure that there is a delay of at least two module clock cycles after it sets the I2C_I2CR[RSTA] bit and before writing to the I2C_I2DR register. The maximum possible clock period of the module clock is 78 ns.

32.7 I2C Memory Map/Register Definition

The I2C contains five 16-bit registers.

NOTE

Registers at offsets 0x0002, 0x0006, 0x000A, and 0x000E are reserved for future additions.

I2C memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
21A_0000	I2C Address Register (I2C1_IADR)	16	R/W	0000h	32.7.1/1443

32.7.1 I2C Address Register (I2Cx_IADR)

Address: Base address + 0h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Read	0								ADR								0
Write																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

I2Cx_IADR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7–1 ADR	Slave address. Contains the specific slave address to be used by the I2C. Slave mode is the default I2C mode for an address match on the bus. NOTE: The I2C_IADR holds the address to which the I2C responds when addressed as a slave. The slave address is not the address sent on the bus during the address transfer. The register is not reset by a software reset.
0 Reserved	This read-only field is reserved and always has the value 0.

32.7.2 I2C Frequency Divider Register (I2Cx_IFDR)

The I2C_IFDR provides a programmable prescaler to configure the clock for bit-rate selection. The register does not get reset by a software reset.

I2C clock is sourced from PERCLK_ROOT which is routed from IPG_CLK_ROOT. I2C clock frequency can easily be obtained by using the following formula:

I2C clock Frequency = (PERCLK_ROOT frequency)/(division factor corresponding to IFDR)

By default, IPG_CLK_ROOT and PERCLK_ROOT frequencies are set to 49.5 MHz, where the root clock is sourced from PLL2's PFD2. Obtaining the frequencies can be accomplished by:

$$\text{PLL2} = 528 \text{ MHz}$$

$$\text{PLL2_PFD2} = 528 \text{ MHz} * 18 / 24 = 396 \text{ MHz}$$

$$\text{IPG_CLK_ROOT} = (\text{PLL2_PFD2} / \text{ahb_podf}) / \text{ipg_podf} = (396 \text{ MHz}/4)/2 = 49.5 \text{ MHz}$$

$$\text{PER_CLK_ROOT} = \text{IPG_CLK_ROOT}/\text{perclk_podf} = 49.5 \text{ MHz}/1 = 49.5 \text{ MHz}$$

NOTE

The above calculation assumes that the default CCM register settings, routing, and division factors are used. If different routing, PFD values, and/or division factors are used, the user must adjust the parameters accordingly to calculate the correct clock frequency.

The following table describes the divider and register values for the register field "IC."

Table 32-3. I2C_IFDR Register Field Values

IC	Divider		IC	Divider		IC	Divider		IC	Divider
0x00	30		0x10	288		0x20	22		0x30	160

Address: Base address + 4h offset

I2Cx_IFDR field descriptions

Field	Description
15–6 Reserved	This read-only field is reserved and always has the value 0.
IC	I2C clock rate. Prescales the clock for bit-rate selection. Due to potentially slow I2Cn_SCL and I2Cn_SDA rise and fall times, bus signals are sampled at the prescaler frequency. The serial bit clock frequency may be lower than IPG_CLK_ROOT divided by the divider shown in the I2C Data I/O Register. NOTE: The IC value should not be changed during the data transfer, however, it can be changed before a Repeat Start or Start programming sequence in I2C. The I2C protocol supports bit rates of up to 400 kbps. The IC bits need to be programmed in accordance with this constraint.

32.7.3 I2C Control Register (I2Cx_I2CR)

The I2C_I2CR is used to enable the I2C and the I2C interrupt. It also contains bits that govern operation as a slave or a master.

Address: Base address + 8h offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read						0	0	
Write	IEN	IEN	MSTA	MTX	TXAK	RSTA		
Reset	0	0	0	0	0	0	0	0

I2Cx_I2CR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 IEN	I2C enable. Also controls the software reset of the entire I2C. Resetting the bit generates an internal reset to the block. If the block is enabled in the middle of a byte transfer, Slave mode ignores the current bus transfer and starts operating when the next Start condition is detected. Master mode is not aware that the bus is busy, so initiating a start cycle may corrupt the current bus cycle, ultimately causing either the current master or the I2C to lose arbitration. Subsequently, bus operation returns to normal. 0 The block is disabled, but registers can still be accessed. 1 The I2C is enabled. This bit must be set before any other I2C_I2CR bits have an effect.
6 I2EN	I2C interrupt enable. NOTE: If data is written during the Start condition, that is, just after setting the I2C_I2CR[MSTA] and I2C_I2CR[MTX] bits, then the ICF bit is cleared at the falling edge of SCLK after Start. If data is written after the Start condition and falling edge of SCLK, then the ICF bit is cleared as soon as data is written. 0 I2C interrupts are disabled, but the status flag I2C_I2SR[IIF] continues to be set when an Interrupt condition occurs. 1 I2C interrupts are enabled. An I2C interrupt occurs if I2C_I2SR[IIF] is also set.
5 MSTA	Master/Slave mode select bit. If the master loses arbitration, MSTA is cleared without generating a Stop signal. NOTE: The module clock should be on for writing to the MSTA bit. NOTE: The MSTA bit is cleared by software to generate a Stop condition; it can also be cleared by hardware when the I2C loses the bus arbitration.

Table continues on the next page...

I2Cx_I2CR field descriptions (continued)

Field	Description
	0 Slave mode. Changing MSTA from 1 to 0 generates a Stop and selects Slave mode. 1 Master mode. Changing MSTA from 0 to 1 signals a Start on the bus and selects Master mode.
4 MTX	Transmit/Receive mode select bit. Selects the direction of master and slave transfers. 0 Receive. When a slave is addressed, the software should set MTX according to the slave read/write bit in the I2C status register (I2C_I2SR[SRW]). 1 Transmit. In Master mode, MTX should be set according to the type of transfer required. Therefore, for address cycles, MTX is always 1.
3 TXAK	Transmit acknowledge enable. Specifies the value driven onto I2Cn_SDA during acknowledge cycles for both master and slave receivers. NOTE: Writing TXAK applies only when the I2C bus is a receiver. 0 An acknowledge signal is sent to the bus at the ninth clock bit after receiving one byte of data. 1 No acknowledge signal response is sent (that is, the acknowledge bit = 1).
2 RSTA	Repeat start. Always reads as 0. Attempting a repeat start without bus mastership causes loss of arbitration. 0 No repeat start 1 Generates a Repeated Start condition
Reserved	This read-only field is reserved and always has the value 0.

32.7.4 I2C Status Register (I2Cx_I2SR)

The I2C_I2SR contains bits that indicate transaction direction and status.

Address: Base address + Ch offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	ICF	IAAS	IBB	IAL	0	SRW	IIF	RXAK
Write				IAL			IIF	
Reset	1	0	0	0	0	0	0	1

I2Cx_I2SR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 ICF	Data transferring bit. While one byte of data is transferred, ICF is cleared. 0 Transfer is in progress. 1 Transfer is complete. This bit is set by the falling edge of the ninth clock of the last byte transfer.
6 IAAS	I2C addressed as a slave bit. The ARM platform is interrupted if the interrupt enable (I2C_I2CR[I IEN]) is set. The ARM platform must check the slave read/write bit (SRW) and set its Transfer/Receive mode accordingly. Writing to I2C_I2CR clears this bit. 0 Not addressed 1 Addressed as a slave. Set when its own address (I2C_IADR) matches the calling address.
5 IBB	I2C bus busy bit. Indicates the status of the bus. NOTE: When I2C is enabled (I2C_I2CR[I IEN] = 1), it continuously polls the bus data (SDA) and clock (SCL) signals to determine a Start or Stop condition. 0 Bus is idle. If a Stop signal is detected, IBB is cleared. 1 Bus is busy. When Start is detected, IBB is set.
4 IAL	Arbitration lost. Set by hardware in the following circumstances (IAL must be cleared by software by writing a "0" to it at the start of the interrupt service routine): <ul style="list-style-type: none"> I2Cn_SDA input samples low when the master drives high during an address or data-transmit cycle. I2Cn_SDA input samples low when the master drives high during the acknowledge bit of a data-receive cycle. For the above two cases, the bit is set at the falling edge of the ninth I2Cn_SCL clock during the ACK cycle. <ul style="list-style-type: none"> A Start cycle is attempted when the bus is busy. A Repeated Start cycle is requested in Slave mode. A Stop condition is detected when the master did not request it. NOTE: Software cannot set the bit. 0 No arbitration lost. 1 Arbitration is lost.
3 Reserved	This read-only field is reserved and always has the value 0.
2 SRW	Slave read/write. When the I2C is addressed as a slave, IAAS is set, and the slave read/write bit (SRW) indicates the value of the R/W command bit of the calling address sent from the master. SRW is valid only when a complete transfer has occurred, no other transfers have been initiated, and the I2C is a slave and has an address match. 0 Slave receive, master writing to slave 1 Slave transmit, master reading from slave
1 IIF	I2C interrupt. Must be cleared by the software by writing a "0" to it in the interrupt routine. NOTE: The software cannot set the bit. 0 No I2C interrupt pending. 1 An interrupt is pending.

Table continues on the next page...

I2Cx_I2SR field descriptions (continued)

Field	Description
	<p>This causes a processor interrupt request (if the interrupt enable is asserted [I IEN = 1]). The interrupt is set when one of the following occurs:</p> <ul style="list-style-type: none"> • One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock). • An address is received that matches its own specific address in Slave Receive mode. • Arbitration is lost.
0 RXAK	<p>Received acknowledge. This is the value received from the I2Cn_SDA input for the acknowledge bit during a bus cycle.</p> <p>0 An "acknowledge" signal was received after the completion of an 8-bit data transmission on the bus. 1 A "No acknowledge" signal was detected at the ninth clock.</p>

32.7.5 I2C Data I/O Register (I2Cx_I2DR)

In Master Receive mode, reading the data register allows a read to occur and initiates the next byte to be received. In Slave mode, the same function is available after it is addressed.

Address: Base address + 10h offset

I2Cx_I2DR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
DATA	<p>Data Byte. Holds the last data byte received or the next data byte to be transferred. Software writes the next data byte to be transmitted or reads the data byte received.</p> <p>NOTE: The core-written value in I2C_I2DR cannot be read back by the core. Only data written by the I2C bus side can be read.</p>

Chapter 33

IOMUX Controller (IOMUXC)

33.1 Overview

The IOMUX Controller (IOMUXC), together with the IOMUX, enables the IC to share one pad to several functional blocks. This sharing is done by multiplexing the pad's input and output signals.

Every module requires a specific pad setting (such as pull up or keeper), and for each pad, there are up to 8 muxing options (called ALT modes). The pad settings parameters are controlled by the IOMUXC.

The IOMUX consists only of combinatorial logic combined from several basic IOMUX cells. Each basic IOMUX cell handles only one pad signal's muxing.

[Figure 33-1](#) illustrates the IOMUX/IOMUXC connectivity in the system.

Figure 33-1. IOMUX SoC Level Block Diagram

33.1.1 Features

The IOMUXC features are:

- 32-bit software mux control registers (IOMUXC_SW_MUX_CTL_PAD_<PAD NAME> or IOMUXC_SW_MUX_CTL_GRP_<GROUP NAME>) to configure 1 of 8 alternate (ALT) MUX_MODE fields of each pad or a predefined group of pads and to enable the forcing of an input path of the pad(s) (SION bit).
- 32-bit software pad control registers (IOMUXC_SW_PAD_CTL_PAD_<PAD_NAME> or IOMUXC_SW_PAD_CTL_GRP_<GROUP NAME>) to configure specific pad settings of each pad, or a predefined group of pads.
- 32-bit general purpose registers - 14 (GPR0 to GPR13) 32-bit registers according to SoC requirements for any usage.
- 32-bit input select control registers to control the input path to a module when more than one pad drives this module input.

Each SW MUX/PAD CTL IOMUXC register handles only one pad or one pad's group.

Only the minimum number of registers required by software are implemented by hardware. For example, if only ALT0 and ALT1 modes are used on Pad x then only one bit register will be generated as the MUX_MODE control field in the software mux control register of Pad x.

The software mux control registers may allow the forcing of pads to become input (input path enabled) regardless of the functional direction driven. This may be useful for loopback and GPIO data capture.

33.2 Clocks

The table found here describes the clock sources for IOMUXC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 33-1. IOMUXC Clocks

Clock name	Clock Root	Description
ipt_clk_io		IO clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

33.3 Functional description

This section provides a complete functional description of the block.

The IOMUXC consists of two sub-blocks:

- IOMUXC_REGISTERS includes all of the IOMUXC registers (see [Features](#)).
- IOMUXC_LOGIC includes all of the IOMUXC combinatorial logic (IP interface controls, address decoder, observability muxes).

The IOMUX consists of a number (about the number of pads in the SoC) of basic iomux_cell units. If only one functional mode is required for a specific pad, there is no need for IOMUX and the signals can be connected directly from the module to the I/O. The IOMUX cell is required whenever two or more functional modes are required for a specific pad or when one functional mode and the one test mode are required.

The basic iomux_cell design, which allows two levels of HW signal control (in ALT6 and ALT7 modes - ALT7 gets highest priority) is shown in [Figure 33-2](#).

Figure 33-2. IOMUX Cell Block Diagram

33.3.1 ALT6 and ALT7 extended muxing modes

The ALT7 and ALT6 extended muxing modes allow any signal in the system (such as fuse, pad input, JTAG, or software register) to override any software configuration and to force the ALT6/ALT7 muxing mode.

It also allows an IOMUX software register to control a group of pads.

33.3.2 SW Loopback through SION bit

A limited option exists to override the default pad functionality and force the input path to be active (`ipp_ibe==1'b1`) regardless of the value driven by the corresponding module. This can be done by setting the SION (Software Input On) bit in the IOMUXC_SW_MUX_CTL register (when available) to "1".

Uses include:

- LoopBack - Module x drives the pad and also receives pad value as an input.
- GPIO Capture - Module x drives the pad and the value is captured by GPIO.

33.3.3 Daisy chain - multi pads driving same module input pin

In some cases, more than one pad may drive a single module input pin. Such cases require the addition of one more level of IOMUXing; all of these input signals are muxed, and a dedicated software controlled register controls the mux in order to select the required input path.

A module port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC_SW_MUX_CTL_<PAD> registers) and one for defining it as the input path (via the daisy chain registers).

This means that a module port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC_SW_MUX_CTL_<PAD> registers) and one for defining it as the input path (via the daisy chain registers). The daisy chain is illustrated in the figure below.

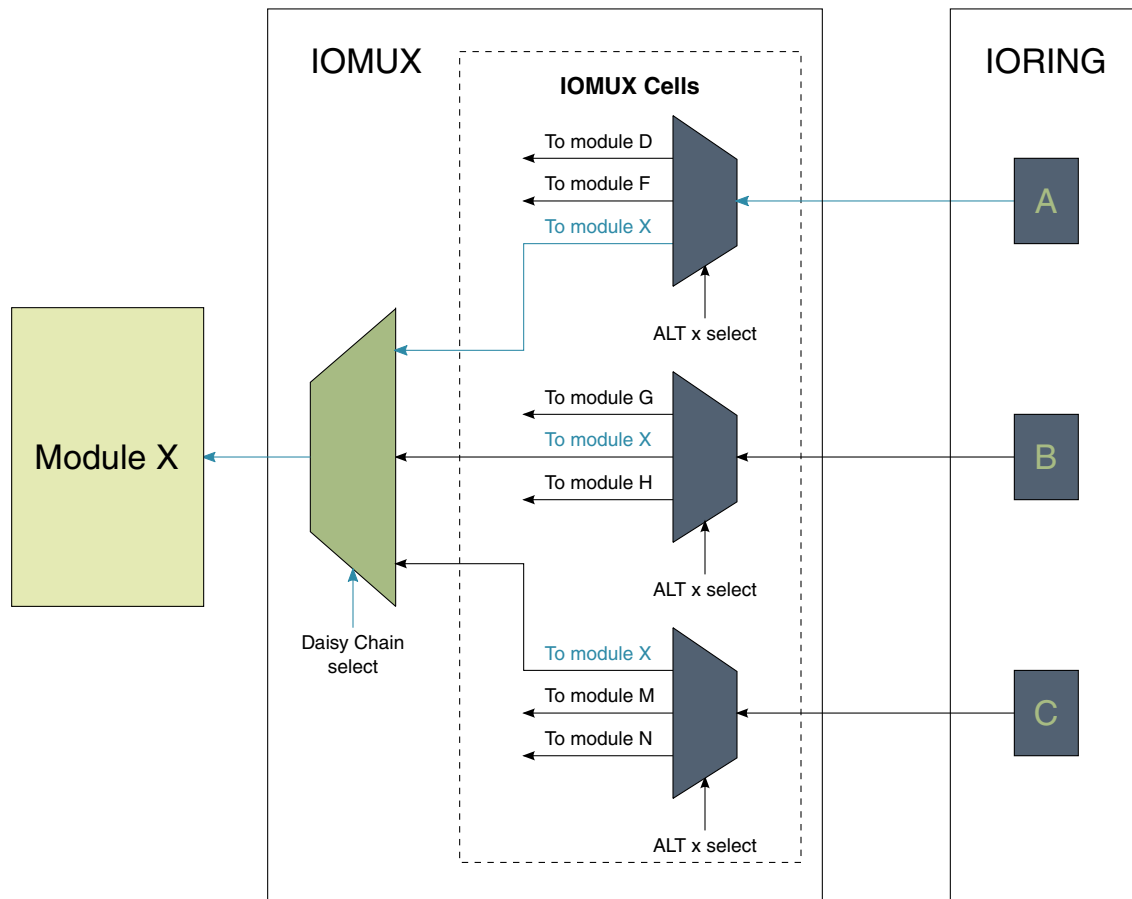

Figure 33-3. Daisy chain illustration

33.4.4 GPR3 General Purpose Register (IOMUXC_GPR_GPR3)

GPR Register

Address: 20E_4000h base + Ch offset = 20E_400Ch

IOMUXC_GPR_GPR3 field descriptions

Field	Description
31–20 -	This field is reserved. Reserved
19–16 OCRAM_ STATUS	<p>This field shows the OCRAM pipeline settings status, controlled by OCRAM_CTL[24:21] bits respectively. When the control bit is changed, the corresponding status bit goes high and keeps high until this new configuration is applied the internal logic. This provides a way for software to detect that the configuration has become valid. The suggested flow for changing the configuration in software is:</p> <ul style="list-style-type: none"> • set/clear the control bit • poll the status bit until it goes to 0 <p>OCRAM_STATUS[19] shows the write address pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory.</p> <p>OCRAM_STATUS[18] shows the write data pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory.</p> <p>OCRAM_STATUS[17] shows the read address pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory.</p> <p>OCRAM_STATUS[16] shows the read data pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory.</p> <p>0 read data pipeline configuration valid 1 read data pipeline control bit changed</p>
15–14 -	This field is reserved. Reserved
13 CORE_DBG_ ACK_EN	<p>Mask control of Core debug acknowledge to global debug acknowledge</p> <p>0 Core debug acknowledge is part of global acknowledge. 1 Core debug acknowledge is masked by this bit, and it is not part of global acknowledge.</p>
12 -	This field is reserved. Reserved
11–4 -	This field is reserved. Reserved
OCRAM_CTL	<p>OCRAM_CTL[3] write address pipeline control bit.</p> <p>When this feature is enabled, the write address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid setup time issue for the write access on the memory cell at high frequency. Enable this feature would cost at most 1 more clock cycle for each AXI write transaction, i.e., at most 1 more clock cycle for each write burst with multiple beats of data. When this feature is disabled, the write address from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write data is also ready at this cycle).</p> <p>0 write address pipeline is disabled 1 write address pipeline is enabled</p> <p>OCRAM_CTL[2] - write data pipeline control bit</p> <p>When this feature is enabled, the write data from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid setup time issue for the write access on the memory cell at high frequency. Enabling this feature would cost at most 1 more clock cycle for each AXI write transaction, i.e., at most 1 more clock cycle for each write burst with multiple beats of data.</p>

IOMUXC_SW_MUX_CTL_PAD_JTAG_MOD field descriptions

Field	Description
31-5 -	This field is reserved. Reserved
4 SION	Software Input On Field. Force the selected mux mode Input path no matter of MUX_MODE functionality. 1 ENABLED — Force input path of pad JTAG_MOD 0 DISABLED — Input Path is determined by functionality
3 -	This field is reserved. Reserved
MUX_MODE	MUX Mode Select Field. Select 1 of 7 iomux modes to be used for pad: JTAG_MOD. 000 ALT0 — Select mux mode: ALT0 mux port: SJC_MOD of instance: sjc 001 ALT1 — Select mux mode: ALT1 mux port: GPT2_CLK of instance: gpt2 010 ALT2 — Select mux mode: ALT2 mux port: SPDIF_OUT of instance: spdif

Chapter 34

Keypad Port (KPP)

34.1 Overview

The Keypad Port (KPP) is a 16-bit peripheral that can be used as a keypad matrix interface or as general purpose input/output (I/O).

The figure below shows the KPP block diagram. The KPP provides interface for the keypad matrix with 2-point contact or 3-point contact keys. The KPP is designed to simplify the software task of scanning a keypad matrix. With appropriate software support, the KPP is capable of detecting, debouncing, and decoding one or multiple keys pressed simultaneously on the keypad.

Figure 34-1. KPP Peripheral Block Diagram

34.1.1 Features

The KPP includes these distinctive features:

- Supports up to an 8 x 8 external key pad matrix
- Port pins can be used as general purpose I/O
- Open drain design
- Glitch suppression circuit design
- Multiple-key detection
- Long key-press detection
- Standby key-press detection
- Synchronizer chain clear
- Supports a 2-point and 3-point contact key matrix

34.1.2 Modes and Operations

This block supports the following modes:

- Run Mode-This is the normal functional mode in which the KPP can detect any key press event.
- Low Power Mode-The keypad can detect any key press even in low power modes (when there is no MCU clock).

34.2 Clocks

The table found here describes the clock sources for KPP.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 34-1. KPP Clocks

Clock name	Clock Root	Description
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32 kHz)
ipg_clk_s	ipg_clk_root	Peripheral access clock

34.3 External Signals

There are several pins dedicated to the KPP. Keypads of any configuration up to eight rows and eight columns are supported through the software configuration of the peripheral pins. Any pins not used for the keypad are available as general purpose I/O. The registers are configured such that the pins can be treated as an I/O port up to 16 bits wide.

See the table below for the list of external signals.

Table 34-2. KPP External Signals

Signal	Description	Pad	Mode	Direction
KPP_COL0	Column input or output pin, from chip	ENET1_RX_DATA1	ALT6	IO

KPP_ROW2	Row input or output pin, from chip	ENET1_RX_DATA1	ALT6	IO
		NAND_DATA02	ALT3	
KPP_ROW3	Row input or output pin, from chip	ENET1_TX_CLK	ALT6	IO
KPP_ROW4	Row input or output pin, from chip	ENET2_RX_DATA0	ALT6	IO
KPP_ROW5	Row input or output pin, from chip	ENET2_RX_EN	ALT6	IO
KPP_ROW6	Row input or output pin, from chip	ENET2_TX_DATA1	ALT6	IO
KPP_ROW7	Row input or output pin, from chip	ENET2_TX_CLK	ALT6	IO

34.3.1 Input Pins

Any of the 16 pins associated with the KPP can be configured as inputs by writing a "0" to the appropriate bits in the KPP_KDDR. Additionally, the least significant 8 bits (ROW inputs) corresponding to KPP_KDDR[KRDD] have internal pull-ups, which are enabled when the pin is used as an input.

34.3.2 Output Pins

Any of the 16 pins associated with the KPP can be configured as outputs by writing the appropriate bits in the KPP_KDDR to a "1". Additionally, the 8 most significant bits (15-8) can be designated as open drain outputs by writing a "1" to the appropriate bits in the KPP_KPCR. The lower 8 bits (7-0) are always in "totem pole" style, driven when configured as outputs.

See the table below.

Table 34-3. Keypad Port Column Modes

KPP_KDDR (15:8)	KPP_KPCR (15:8)	Pin Function
0	x	Input
1	0	Totem-Pole Output
1	1	Open-Drain Output

NOTE

Totem pole capability should be provided for column pins. Totem pole configuration helps for a faster discharge of keypad capacitance when all columns need to be quickly brought to a "1" during the scan routine. With this configuration, delay between the scanning of two subsequent columns is reduced.

34.3.3 Generation of Transfer Error Signal on Peripheral Bus

If there is an access to an address which is not implemented, then the KPP asserts a transfer error signal on Peripheral Bus.

34.4 Functional Description

The Keypad Port (KPP) is designed to simplify the software task of scanning a keypad matrix. With appropriate software support and matrix organization, the KPP is capable of detecting, debouncing, and decoding one or more keys pressed simultaneously on the keypad.

Logic in the KPP is capable of detecting a key press even while the processor is in one of the low power standby modes provided that a low frequency reference clock (`ipg_clk_32k`) is on. The KPP may generate an ARM platform interrupt any time a key press or key release is detected. This interrupt is capable of forcing the processor out of a low power mode.

34.4.1 Keypad Matrix Construction

The KPP is designed to interface to a keypad matrix, which shorts the intersecting row and column lines together whenever a key is depressed. The interface is not optimized for any other switch configuration.

34.4.2 Keypad Port Configuration

The software must initialize the KPP for the size of the keypad matrix. Pins connected to the keypad columns should be configured as open-drain outputs. Pins connected to the keypad rows should be configured as inputs. On-chip, pull-up resistors should be implemented for active keypad rows.

In addition to enabled row inputs in the Keypad Control register, corresponding interrupt (depress or/and release) must also be enabled to generate an interrupt.

Discrete switches that are not part of the matrix may be connected to any unused row inputs. The second terminal of the discrete switch is connected to ground. The hardware detects closures of these switches without the need for software polling.

34.4.3 Keypad Matrix Scanning

Keypad scanning is performed by a software loop that walks a zero across each of the keypad columns, reading the value on the rows at each step. The process is repeated several times in succession, with the results of each pass optionally compared to those

from the previous pass. When several (3 or 4) consecutive scans yield the same key closures, a valid key press has been detected. Software then can decode exactly which switch was depressed and pass the value up to the next higher software layer.

The basic debouncing period, which must be defined in the software routine, may be controlled with an internal timer. The basic period is the period between the scan of two consecutive columns, so the debouncing time between two consecutive scans of the whole matrix shall be the number of columns multiplied by the basic period.

34.4.4 Keypad Standby

There is no need for the ARM platform to continually scan the keypad. Between key presses, the keypad can be left in a state that requires no software intervention until the next key press is detected. To place the keypad in a standby state, software should write all column outputs low. Row inputs are left enabled. At this point, the ARM platform can attend to other tasks or revert to a low power standby mode. The KPP will interrupt the ARM platform if any key is pressed.

Upon receiving a keypad interrupt, the ARM platform should set all the column strobes high, and begin a normal keypad scanning routine to determine which key was pressed. It is important that open-drain drivers be used when scanning to prevent a possible DC path between power and ground through two or more switches.

34.4.5 Glitch Suppression on Keypad Inputs

A glitch suppression circuit qualifies the keypad inputs to prevent noise from inadvertently interrupting the ARM platform. The circuit is a 4-state synchronizer clocked from a low frequency reference clock (`ipg_clk_32k`) source. This clock must continue to run in any low power mode where the keypad is a wake-up source, as the ARM platform interrupt is generated from the synchronized input. An interrupt is not generated until all four synchronizer stages have latched a valid key assertion. This guarantees the filtering out of any noise less than three clock periods in duration of a low frequency reference clock. Noise filtering of the duration between three to four clock periods cannot be guaranteed. The interrupt output is latched in an S-R latch and remains asserted until cleared by the software. The Set input of the latch is rising-edge clocked. See the figure below.

Figure 34-2. Keypad Synchronizer Functional Diagram

34.4.6 Multiple Key Closures

Using the key press and key release interrupts, the software can detect multiple keys or achieve n key rollover. The key scanning routine can be programmed accordingly (See [Initialization/Application Information](#) for more information).

The following figures illustrate the interface of a 2-contact keypad matrix with the KPP controller. With proper enabling of row lines and the performing scan-routine, multiple key presses can be detected. When keys present on the same row are pressed, corresponding row lines (multiple lines) become low when the column is driven low during a scan-routine. By reading the data-register, pressed keys can be detected.

Similarly, when keys present on same row line are pressed, the corresponding row line (only one line) becomes low when logic "0" is driven on the column line during a scan-routine.

Figure 34-3. Multiple Key Presses on Same Column Line (Simplified View)

Figure 34-4. Multiple Key Presses on Same Row Line (Simplified View)

NOTE

An n key rollover is a technique with which the system can recognize the order in which keys are pressed.

34.4.6.1 Ghost Key Problem and Correction

The KPP detects if one or multiple keys are pressed or released. In the case where a simple keypad matrix with two-contact switches is used, there is a chance of "ghost" key detection when three or more keys are pressed. This is a limitation imposed by such a keypad matrix.

As seen in [Figure 34-5](#), three keys pressed simultaneously can cause a short between the column currently "scanned" by the software and another column. Depending on the location of the third key pressed, a "ghost" key press may be detected.

However, this can be corrected by using a keypad matrix that provides "ghost" key protection. Such a matrix implements a one-way "diode" at all keypad points between rows and columns. This way, the multiple pressing of three keys will not cause a short at a fourth key (see [Figure 34-6](#)).

Figure 34-5. Decoding Wrong Three- Key-Presses

Figure 34-6. Matrix with "Ghost" Key Protections

34.4.7 3-Point Contact Keys Support

The KPP supports interfacing to a matrix consisting of 3-point contact keys. As shown in [Figure 34-7](#), two points of such a key are connected to keypad lines, while a third point is connected to ground (low logic).

The keypad lines should be configured as input and a pull-up should be present on these lines. When such a key is pressed, corresponding keypad lines go low and an interrupt is generated. There is no need to perform a scanning routine for identification of pressed key as it can be done by reading the keypad data-register. A limitation with such a matrix is that for every key at least one keypad row line should be used.

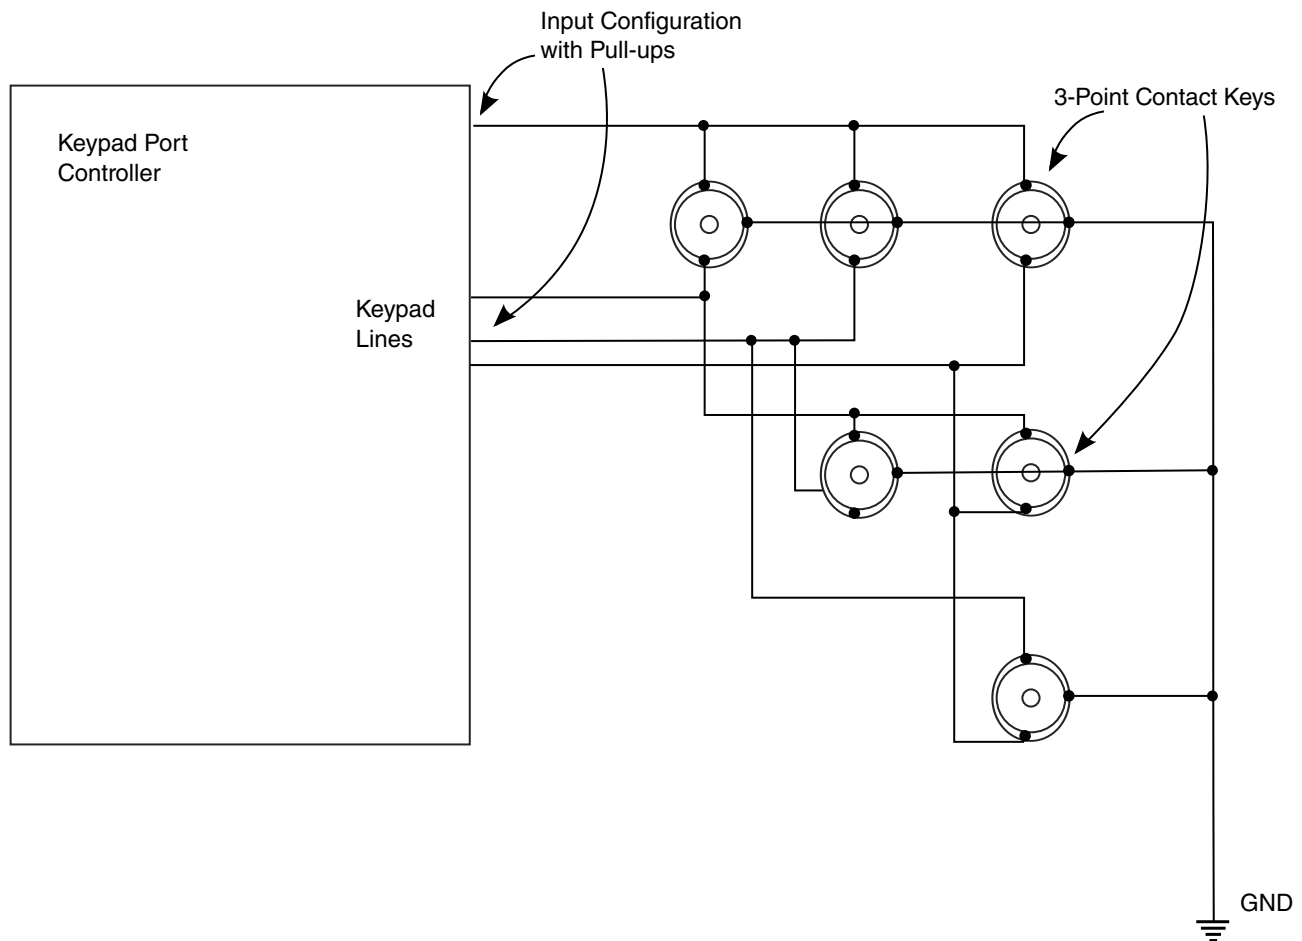

Figure 34-7. KPP Interface with 3-point Contact Key Matrix (Simplified View)

34.5 Initialization/Application Information

34.5.1 Typical Keypad Configuration and Scanning Sequence

Perform the following steps to configure the keypad:

1. Enable the number of rows in the keypad (KPP_KPCR[KRE]).
2. Write 0s to KPP_KPDR[KCD].
3. Configure the keypad columns as open-drain (KPP_KPCR[KCO]).
4. Configure columns as output (KPP_KDDR[KCDD]) and rows as input (KPP_KDDR[KRDD]).
5. Clear the KPKD Status Flag and Synchronizer chain.
6. Set the KDIE control bit, and clear the KRIE control bit (avoid false release events).

7. (The system is now in standby mode, and awaiting a key press.)

34.5.2 Key Press Interrupt Scanning Sequence

Perform the following steps to perform a keypad scanning routine:

1. Disable both (depress and release) keypad interrupts.
2. Write 1s to KPP_KPDR[KCD], setting column data to 1s.
3. Configure columns as totem pole outputs (for quick discharging of keypad capacitance).
4. Configure columns as open-drain.
5. Write a single column to 0, and other columns to 1.
6. Sample row inputs and save data. Multiple key presses can be detected on a single column.
7. Repeat Steps 2-6 for remaining columns.
8. Return all columns to 0 in preparation for standby mode.
9. Clear KPKD and KPKR status bit(s) by writing to a "1"; set the KPKR synchronizer chain by writing a "1" to the KPP_KRSS register; and clear the KPKD synchronizer chain by writing a "1" to the KDSC register.
10. Re-enable the appropriate keypad interrupt(s) so that the KDIE detects a key hold condition, or the KRIE detects a key-release event.

34.5.3 Additional Comments

The order of key press detection can be done in software only. Therefore, the software may need to run the scan routines at very short intervals of time per the application's demands. The reason that such functionality cannot be put in the KPP is that the block is limited by the number of external pins.

For the keys that require a very precise order (such as game keys), individual GPIO pins may be more useful.

34.6 KPP Memory Map/Register Definition

The KPP contains four registers.

KPP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20B_8000	Keypad Control Register (KPP_KPCR)	16	R/W	0000h	34.6.1/2105
20B_8002	Keypad Status Register (KPP_KPSR)	16	R/W	0400h	34.6.2/2106
20B_8004	Keypad Data Direction Register (KPP_KDDR)	16	R/W	0000h	34.6.3/2107
20B_8006	Keypad Data Register (KPP_KPDR)	16	R/W	0000h	34.6.4/2108

34.6.1 Keypad Control Register (KPP_KPCR)

The Keypad Control Register determines which of the eight possible column strobes are to be open drain when configured as outputs, and which of the eight row sense lines are considered in generating an interrupt to the core.

It is up to the programmer to ensure that pins being used for functions other than the keypad are properly disabled. The KPP_KPCR register is byte- or half-word-addressable.

Address: 20B_8000h base + 0h offset = 20B_8000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	KCO								KRE							
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

KPP_KPCR field descriptions

Field	Description
15–8 KCO	Keypad Column Strobe Open-Drain Enable. Setting a column open-drain enable bit (KCO7-KCO0) disables the pull-up driver on that pin. Clearing the bit allows the pin to drive to the high state. This bit has no effect when the pin is configured as an input. NOTE: Configuration of external port control logic (for example, IOMUX) should be done properly so that the KPP controls an open-drain enable of the pin. 0 TOTEM_POLE — Column strobe output is totem pole drive. 1 OPEN_DRAIN — Column strobe output is open drain.
KRE	Keypad Row Enable. Setting a row enable control bit in this register enables the corresponding row line to participate in interrupt generation. Likewise, clearing a bit disables that row from being used to generate an interrupt. This register is cleared by a reset, disabling all rows. The row-enable logic is independent of the programmed direction of the pin. Writing a "0" to the data register of the pins configured as outputs will cause a keypad interrupt to be generated if the row enable associated with that bit is set. 0 Row is not included in the keypad key press detect. 1 Row is included in the keypad key press detect.

34.6.2 Keypad Status Register (KPP_KPSR)

The Keypad Status Register reflects the state of the key press detect circuit. The KPP_KPSR register is byte- or half-word-addressable.

Address: 20B_8000h base + 2h offset = 20B_8002h

Bit	15	14	13	12	11	10	9	8
Read	0						KRIE	KDIE
Write	[Shaded]							
Reset	0	0	0	0	0	1	0	0
Bit	7	6	5	4	3	2	1	0
Read	0				0	0	KPKR	KPKD
Write	[Shaded]				KRSS	KDSC	w1c	w1c
Reset	0	0	0	0	0	0	0	0

KPP_KPSR field descriptions

Field	Description
15–10 Reserved	This read-only field is reserved and always has the value 0.
9 KRIE	Keypad Release Interrupt Enable. The software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain. 0 No interrupt request is generated when KPKR is set. 1 An interrupt request is generated when KPKR is set.
8 KDIE	Keypad Key Depress Interrupt Enable. Software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice-versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain. 0 No interrupt request is generated when KPKD is set. 1 An interrupt request is generated when KPKD is set.
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 KRSS	Key Release Synchronizer Set. Self-clear bit. The Key release synchronizer is set by writing a logic one into this bit. Reads return a value of "0". 0 No effect 1 Set bits which sets keypad release synchronizer chain

Table continues on the next page...

KPP_KPSR field descriptions (continued)

Field	Description
2 KDSC	<p>Key Depress Synchronizer Clear. Self-clear bit. The Key depress synchronizer is cleared by writing a logic "1" into this bit.</p> <p>Reads return a value of "0".</p> <p>0 No effect 1 Set bits that clear the keypad depress synchronizer chain</p>
1 KPKR	<p>Keypad Key Release. The keypad key release (KPKR) status bit is set when all enabled rows are detected high after synchronization (the KPKR status bit will be set when cleared by a reset). The KPKR bit may be used to generate a maskable key release interrupt. The key release synchronizer may be set high by software after scanning the keypad to ensure a known state. Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by software prior to the system exiting the state it represents.</p> <p>Reset value of register is "0" as long as reset is asserted. However when reset is de-asserted, the value of the register depends upon the external row pins and can become "1".</p> <p>0 No key release detected 1 All keys have been released</p>
0 KPKD	<p>Keypad Key Depress. The keypad key depress (KPKD) status bit is set when one or more enabled rows are detected low after synchronization. The KPKD status bit remains set until cleared by the software. The KPKD bit may be used to generate a maskable key depress interrupt. If desired, the software may clear the key press synchronizer chain to allow a repeated interrupt to be generated while a key remains pressed. In this case, a new interrupt will be generated after the synchronizer delay (4 cycles of the low frequency reference clock (ipg_clk_32k) elapses if a key remains pressed. This functionality can be used to detect a long key press. This allows detection of additional key presses of the same key or other keys.</p> <p>Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by the software prior to the system exiting the state it represents.</p> <p>0 No key presses detected 1 A key has been depressed</p>

34.6.3 Keypad Data Direction Register (KPP_KDDR)

The bits in the KPP_KDDR control the direction of the keypad port pins. The upper eight bits in the register affect the pins designated as column strobes, while the lower eight bits affect the row sense pins. Setting any bit in this register configures the corresponding pin as an output. Clearing any bit in this register configures the corresponding port pin as an input. For the Keypad Row DDR, an internal pull-up is enabled if the corresponding bit is clear. This register is cleared by a reset, configuring all pins as inputs. The KPP_KDDR register is byte- or half-word addressable.

NOTE

When a pin is used as row pin for keypad purposes, all corresponding pull-ups should be enabled at the upper level (for example, IOMUX) when the bit in KRDD is cleared.

KPP Memory Map/Register Definition

Address: 20B_8000h base + 4h offset = 20B_8004h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

KPP_KDDR field descriptions

Field	Description
15–8 KCDD	Keypad Column Data Direction Register. Setting a bit configures the corresponding COL n pin as an output (where $n = 7$ through 0). 0 INPUT — COL n pin is configured as an input. 1 OUTPUT — COL n pin is configured as an output.
KRDD	Keypad Row Data Direction. Setting a bit configures the corresponding ROW n pin as an output (where $n = 7$ through 0). 0 INPUT — ROW n pin configured as an input. 1 OUTPUT — ROW n pin configured as an output.

34.6.4 Keypad Data Register (KPP_KPDR)

This 16-bit register is used to access the column and row data. Data written to this register is stored in an internal latch, and for each pin configured as an output, the stored data is driven onto the pin. A read of this register returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register.

The KPP_KPDR register is byte- or half-word addressable. This register is not initialized by a reset. Valid data should be written to this register before any bits are configured as outputs.

Address: 20B_8000h base + 6h offset = 20B_8006h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Chapter 35

Enhanced LCD Interface (eLCDIF)

35.1 Overview

The enhanced Liquid Crystal Display Interface (eLCDIF) is a general purpose display controller used to drive a wide range of display devices varying in size and capability.

The eLCDIF block supports the following:

- Displays with an asynchronous parallel MPU interface for command and data transfer to an integrated frame buffer.
- Displays that support moving pictures and require the RGB interface mode (DOTCLK interface).
- VSYNC mode for high-speed data transfers.
- Digital video encoders that accept ITU-R BT.656 format 4:2:2 YCbCr digital component video and convert it to analog TV signals.

The eLCDIF provides fully programmable functionality to supported interfaces:

- Bus master interface to source frame buffer data for display refresh. This interface can also be used to drive data for "Smart" displays.
- PIO interface to manage data transfers between "Smart" displays and SoC.
- 8/16/18/24/32 bit LCD data bus support available depending on I/O mux options.
- Programmable timing and parameters for MPU, VSYNC, and DOTCLK LCD interfaces to support a wide variety of displays.
- ITU-R BT.656 mode (called Digital Video Interface or DVI mode here) including progressive-to-interlace feature and RGB to YCbCr 4:2:2 color space conversion to support 525/60 and 625/50 operation.

35.2 External Signals

The following table describes the external signals of LCD:

Table 35-1. LCD External Signals

Signal	Description	Pad	Mode	Direction
LCD_BUSY	Busy Signal	LCD_VSYNC	ALT1	I
LCD_CLK	Clock signal	LCD_CLK	ALT0	I
LCD_CS	Chip select	LCD_RESET	ALT1	O
LCD_DATA0	Data signals	LCD_DATA00	ALT0	IO

35.3 Clocks

The following table describes the clock sources for eLCDIF. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 35-2. eLCDIF Clocks

Clock name	Clock Root	Description
apb_clk	axi_clk_root	AXI clock
pix_clk	lcdif_pix_clk_root	Pixel clock

35.4 Functional Description

[Bus Interface Mechanisms](#) through [Initializing the eLCDIF](#), describe the internal pipeline for the eLCDIF interfaces. Differences for each mode are then described in separate sections, as follows:

- [MPU Interface](#)
- [VSYNC Interface](#)
- [DOTCLK Interface](#)
- [ITU-R BT.656 Digital Video Interface \(DVI\)](#)

eLCDIF pin usage by interface mode is described in [eLCDIF Pin Usage by Interface Mode](#).

Figure 35-1. Top-Level Block Diagram of eLCDIF subsystem

35.4.1 Bus Interface Mechanisms

The LCDIF module has memory-mapped control, data and status registers. It provides several interfaces to transfer data between the display and SoC.

The bus master interface is used to initiate the requests to transfer data from external memory to the display. It is completely autonomous, or no CPU intervention is required, to manage the cyclical nature of refreshing standard display types. Bus mastering can also be used for MPU mode data writes.

The PIO interface is used to interface to "Smart" displays to transfer frame buffer data and control information to/from the external display. The host CPU executes display drivers to manage the display solution. The following sections describe the system bus interface mechanisms.

35.4.1.1 Bus Master Operation in Write/Display Modes

The eLCDIF block has a bus master interface that initiates requests for data to drive the display. The LCDIF_MASTER bit must be set to 1 to enable the bus master interface. Software should program all control registers required to transfer the frame sequence.

In the MPU and VSYNC mode, single frames are transferred. When a complete frame is transferred, eLCDIF enters idle and clears the RUN bit in the CTRL register. For subsequent frame transmission, the eLCDIF setup sequence should be repeated.

The DOTCLK and DVI mode are used to refresh the display at the desired refresh rate and resolution, and drive displays that don't integrate a display buffer memory. When the display is refreshed, the eLCDIF will automatically update the LCDIF_CUR_BUF_ADDR register with the value in LCDIF_NEXT_BUF_ADDR at the end of current frame and start fetching the next frame from the new address. If the LCDIF_NEXT_BUF_ADDR register was not updated within a frame refresh cycle, eLCDIF will keep transmitting the last frame until a new value is programmed into that register.

eLCDIF also provides the capability of interlacing a progressive frame by fetching odd lines in the first field and then fetching even lines in the second field. This feature can be used in the DVI mode and can be turned on by setting the INTERLACE_FIELDS bit in the LCDIF_CTRL1 register.

35.4.1.2 System Bus Master Performance

The performance of the eLCDIF block can be controlled by changing the burst length and the outstanding cycle issuing capability depending on the memory bandwidth requirements. Two fields in the LCDIF_CTRL2 register will throttle system memory requests. The LCDIF_CTRL2_OUTSTANDING_REQS field will control how many requests the eLCDIF can have in flight on any given clock cycle. This should be programmed based on the expected system bus latency for returned read data. Also, the LCDIF_CTRL2_BURST_LEN_8 bit will set the number of 64 bit words requested for each eLCDIF system bus request to either 8 or 16 QWORDS. Generally, 4 outstanding requests of length 16 will provide enough performance to drive any standard display

resolution. These configuration bits are intended to change the access pattern of the eLCDIF to optimize system bus throughput when other system masters will contend for system memory resources.

The LCDIF_THRES register can also be used to optimize bus throughput and power consumption.

The LCDIF_THRES_PANIC value can be used to raise the priority of requests initiated by the eLCDIF to alter how the eLCDIF requests are arbitrated by the system bus infrastructure. The panic output control signal is raised when the number of 32bpp pixel equivalents in the LFIFO is less than this programmed value. Since the LFIFO is arranged as a 256x64bit quadword FIFO, it contains two 32bpp pixels per quadword, or 512 32bpp pixels total. To set the panic output when 3/4s of the LFIFO is empty, set the LCDIF_THRES_PANIC value to $3/4 * 512$, or 128. The panic signal output is used to assess higher priority to eLCDIF system requests to avoid eLCDIF under run errors during periods of high system bandwidth utilization.

The features available with the LCDIF_THRES register require support from system clocking and dynamic priority control. Refer to the appropriate block documentation to assess the system support for these features.

35.4.2 Write Data Path

eLCDIF supports raster based frame buffers and there is no support for tiled buffers.

There are several options to accommodate endianness of display buffers in memory before the data is processed for the external display. The LCDIF_CTRL[INPUT_DATA_SWIZZLE] field provides the following options for data word multiplexing:

```
00 (0): No swizzle (little-endian)
01 (1): Swap bytes 0 and 3, swap bytes 1 and 2 (big-endian)
10 (2): Swap half-words
11 (3): Swap bytes within each half-word
```

The LCDIF_CTRL[WORD_LENGTH] field indicates the input data/pixel format. LCDIF_TRANSFER_COUNT register denotes how much data is contained in each frame. The LCDIF_TRANSFER_COUNT[H_COUNT] field indicates the number of pixels per line and LCDIF_TRANSFER_COUNT[V_COUNT] indicates the total number of lines per frame. The LCDIF_CTRL1[BYTE_PACKING_FORMAT] field can be used to specify which bytes within the 32-bit word are going to be valid. For example, if the entire 32-bit word is valid, LCDIF_CTRL1[BYTE_PACKING_FORMAT] should be set to 0xF, if only lower 3 bytes of each word in the frame buffer are valid, then LCDIF_CTRL1[BYTE_PACKING_FORMAT] should be set to 0x7.

The LCDIF_CTRL[LCD_DATABUS_WIDTH] field suggests the width of the bus going to the display controller. There is an option to source all 32 bits of the input word and transfer it to the output I/O display interface. If the LCDIF_CTRL[LCD_DATABUS_WIDTH] is not the same as LCDIF_CTRL[WORD_LENGTH], eLCDIF will perform RGB to RGB color space conversion. For example, if the input frame has fewer bits per pixel than the display, as in a 16 bpp input frame going to 24 bpp LCD, eLCDIF will pad the MSBs of each color to the LSBs of the same color for each pixel. If the input frame has more bits per pixel than the display, for example, 24 bpp input frame going to 16 bpp LCD, eLCDIF will drop the LSBs of each color channel to convert to the lower color depth. eLCDIF also has the capability to support delta pixel displays by swizzling the R, G and B colors of each pixel in the odd and even lines of the frame separately by programming the LCDIF_CTRL2[ODD_LINE_PATTERN] and the LCDIF_CTRL2[EVEN_LINE_PATTERN] bit fields. This operation occurs after the RGB-to-RGB color space conversion operation.

eLCDIF also supports RGB to YCbCr 4:2:2 color space conversion. This is useful in the DVI mode since the TV encoder requires input in YCbCr 4:2:2 format. The LCDIF_CSC* registers have complete programmability over the CSC coefficients and offsets. The values must be written into these registers in the signed two's complement format.

The following list shows how the different input/output combinations can be obtained:

- LCDIF_CTRL[WORD_LENGTH]=1 indicates that the input is 8-bit data. This is most likely going to be used for sending commands in MPU interface, or maybe a gray scale image. Any combination of LCDIF_CTRL1[BYTE_PACKING_FORMAT] is permissible.

Limitation: LCDIF_TRANSFER_COUNT[H_COUNT] must be a multiple of the sum of BYTE_PACKING_FORMAT [3], BYTE_PACKING_FORMAT [2], BYTE_PACKING_FORMAT [1] and BYTE_PACKING_FORMAT [0].
LCDIF_CTRL[LCD_DATABUS_WIDTH] must be 1, indicating an 8-bit data bus.

- LCDIF_CTRL[WORD_LENGTH]=0 implies the input frame buffer is RGB 16 bits per pixel. LCDIF_CTRL[DATA_FORMAT_16_BIT] field determines the pixels are RGB 555 or RGB 565.

Limitation: LCDIF_CTRL1[BYTE_PACKING_FORMAT] should be 0x3 or 0xC if there is only one pixel per word. If there are two pixels per word, it should be 0xF and LCDIF_TRANSFER_COUNT[H_COUNT] will be restricted to be a multiple of 2 pixels.

- LCDIF_CTRL[WORD_LENGTH]=2 indicates that input frame buffer is RGB 18 bits per pixel, that is, RGB 666. The valid RGB values can be left-aligned or right-

aligned within a 32-bit word. The alignment of the valid 18 bits within a word is indicated by the LCDIF_CTRL[DATA_FORMAT_18_BIT] bit.

Limitation: LCDIF_CTRL1[BYTE_PACKING_FORMAT] can be 0x7, 0xE or 0xF. Packed pixels are not supported in this case.

LCDIF_TRANSFER_COUNT[H_COUNT] can be any number.

- LCDIF_CTRL[WORD_LENGTH]=3 indicates that the input frame-buffer is RGB 24 bits per pixel (RGB 888). If LCDIF_CTRL1[BYTE_PACKING_FORMAT] is 0x7, it indicates that there is only one pixel per 32-bit word and there is no restriction on LCDIF_TRANSFER_COUNT[H_COUNT]. This is also the option that provides 32 bit output depending on the I/O muxing options available. The fourth byte, or bits [31:24], and connected to the I/Os if this muxing is available in the chip package.

Limitation: If LCDIF_CTRL1[BYTE_PACKING_FORMAT] is 0xF, it indicates that the pixels are packed, that is, there are 4 pixels in 3 words or 12 bytes and LCDIF_TRANSFER_COUNT[H_COUNT] must be a multiple of 4 pixels.

- LCDIF_CTRL1[YCBCR422_INPUT]=1 implies that the input frame is in YCbCr 4:2:2 format. LCDIF_CTRL1[BYTE_PACKING_FORMAT] must be 0xF.

Limitation: LCDIF_CTRL[LCD_DATABUS_WIDTH] must be 8-bit and LCDIF_TRANSFER_COUNT[H_COUNT] must be a multiple of 2 pixels.

LCDIF_CTRL2[ODD_LINE_PATTERN] and LCDIF_CTRL2[EVEN_LINE_PATTERN] must be 0 when any of LCDIF_CTRL[RGB_TO_YCBCR422_CSC] or LCDIF_CTRL1[INTERLACE_FIELDS] or LCDIF_CTRL[YCBCR422_INPUT] bits is 1.

After the RGB to RGB or RGB to YCbCr 4:2:2 color space conversions, there is one more opportunity to swizzle the data before sending it out to the display or the encoder. This can be done with the LCDIF_CTRL[CSC_DATA_SWIZZLE] field, and it provides the same options as the LCDIF_CTRL[INPUT_DATA_SWIZZLE] register.

Finally, there is an option to shift the output data before sending it out to the display. This is done based on the LCDIF_CTRL[SHIFT_DIR] and LCDIF_CTRL[SHIFT_NUM_BITS] fields.

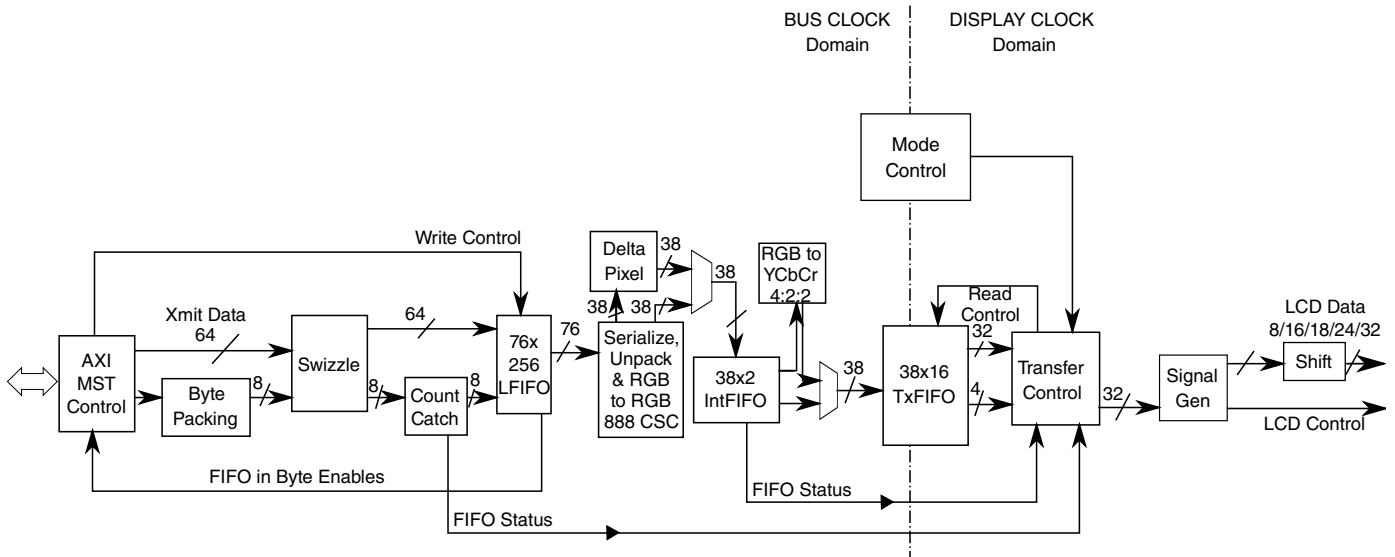

Figure 35-2. General Operations in Write Data Path

The examples in the following figures illustrate some different combinations of register programming for write mode. Assume that the data transferred over the system bus within a 32 bit word is organized as {A7-A0, B7-B0, C7-C0, D7-D0} in 8-bit mode and {A15-A0, B15-B0} in 16-bit mode.

In this example, all 32 bits of the input word are transferred out over an 8 bit display bus. Each byte within the 32 bit word is shifted to the right with zeros appended to bits D[7:6]. The input data bits [7:2] are shifted to the right by 2 bits and presented on the D[5:0].

Figure 35-3. Register programming for write mode

In this 8 bit display interface example, one byte of the input word is deleted and not transferred over the external 8 bit display interface. This mode could be used to transfer 24bpp pixels over the 8 bit interface. In this case, the 4th unused byte is not transferred.

Figure 35-4. Register programming for write mode

The following example uses a 16 bit display interface. Each 16 bit half word is shifted to the right by two bits with zeros appended to the most significant two bits.

Figure 35-5. Register programming for write mode

This example indicates how an unpacked frame buffer can be sourced for display. Only a single 16 bit half word within the 32 bit word is transferred out via the 16 display bus.

Figure 35-6. Register programming for write mode

35.4.3 Read Data Path

Figure 35-7 shows the MPU read data path in detail.

eLCDIF can read from an external display that follows the 6800/8080 MPU protocol.

The display bus width is determined by the `LCD_DATABUS_WIDTH` bit field. The data sampled at every read strobe is called a subword and the number of subwords that can be packed in a 32-bit word is given by the `READ_MODE_NUM_PACKED_SUBWORDS` bit field. The `INITIAL_DUMMY_READ` bit field directs the eLCDIF to skip the number of programmed subwords before starting to process read data. This feature is useful in the case of an LCD controller that returns the last written data the first time a read is issued, and then sends the correct data thereafter. `SHIFT_DIR` and `SHIFT_NUM_BITS` bit fields indicate whether the data needs to be shifted before getting stored in the internal registers. For example, a value of 2 in `READ_MODE_NUM_PACKED_SUBWORDS` if lcd

Functional Description

data bus width is 8 bits indicates two bytes should be packed in a 32-bit word, while if the lcd databus width is 16 bits, it indicates that two half words (or 4 bytes) should be packed.

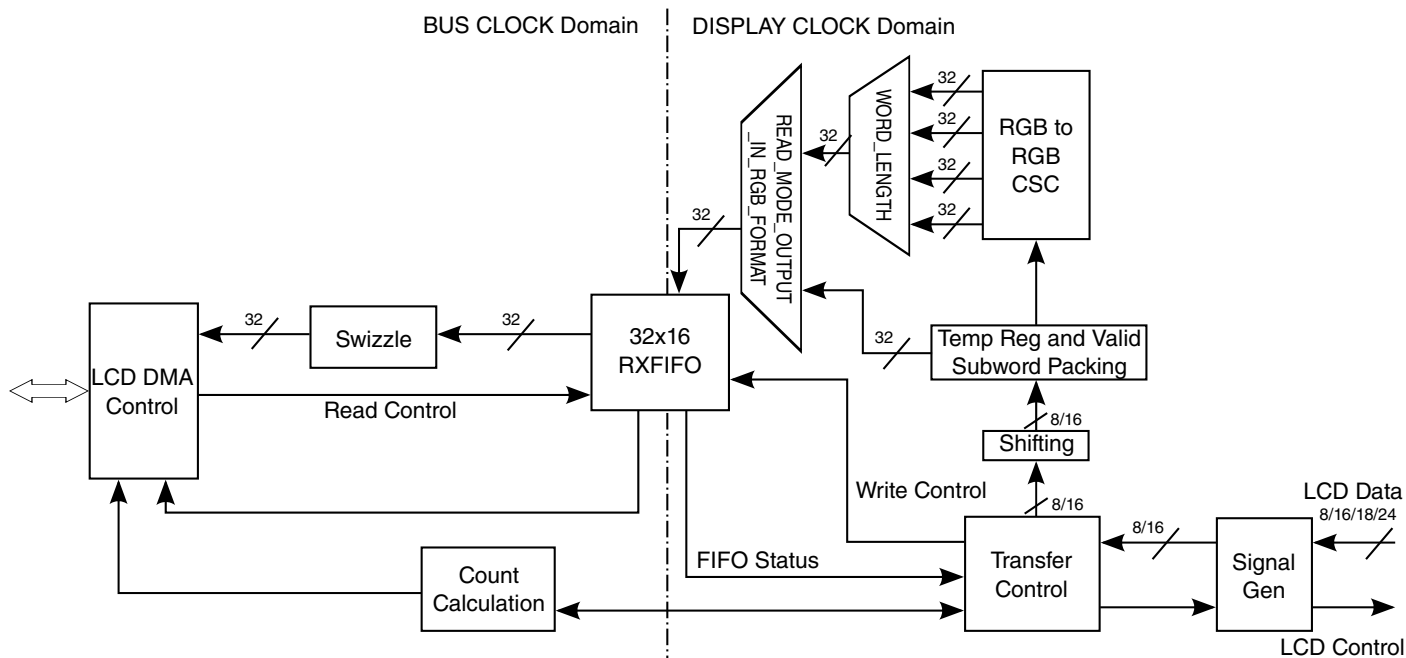

Figure 35-7. MPU Read Data Path

After the last subword within a word is reached, the block looks at the `READ_PACK_DIR` in the `HW_LCDIF_CTRL2` register. If this bit is set, the block will swizzle the data, but only within the valid bytes, unlike in the write mode, where swizzle occurs across all 4 bytes. If the `READ_MODE_OUTPUT_IN_RGB_FORMAT` bit is set, eLCDIF will convert the data obtained from the `READ_PACK_DIR` operation into 24-bit unpacked RGB and then re-convert it into 16/18/24 bpp RGB depending on the `WORD_LENGTH` field. The `DATA_FORMAT_16/18/24_BIT` bit fields are also considered while converting to 24-bit unpacked RGB format. For example, if `DATA_FORMAT_18_BIT` is 1, the RGB666 data will be packed in the upper bits [31:4] of a 32-bit word, and that bit is 0, the data will be packed in the lower bits [17:0]. After all these operations, the data gets written into the RXFIFO.

The following figures show some examples of how data is handled in different MPU read modes.

READ_MODE_NUM_PACKED_SUBWORDS = 2 AND LCD_DATABUS_WIDTH = 8 BITS
 OR
 READ_MODE_NUM_PACKED_SUBWORDS = 1 AND LCD_DATABUS_WIDTH = 16 BITS

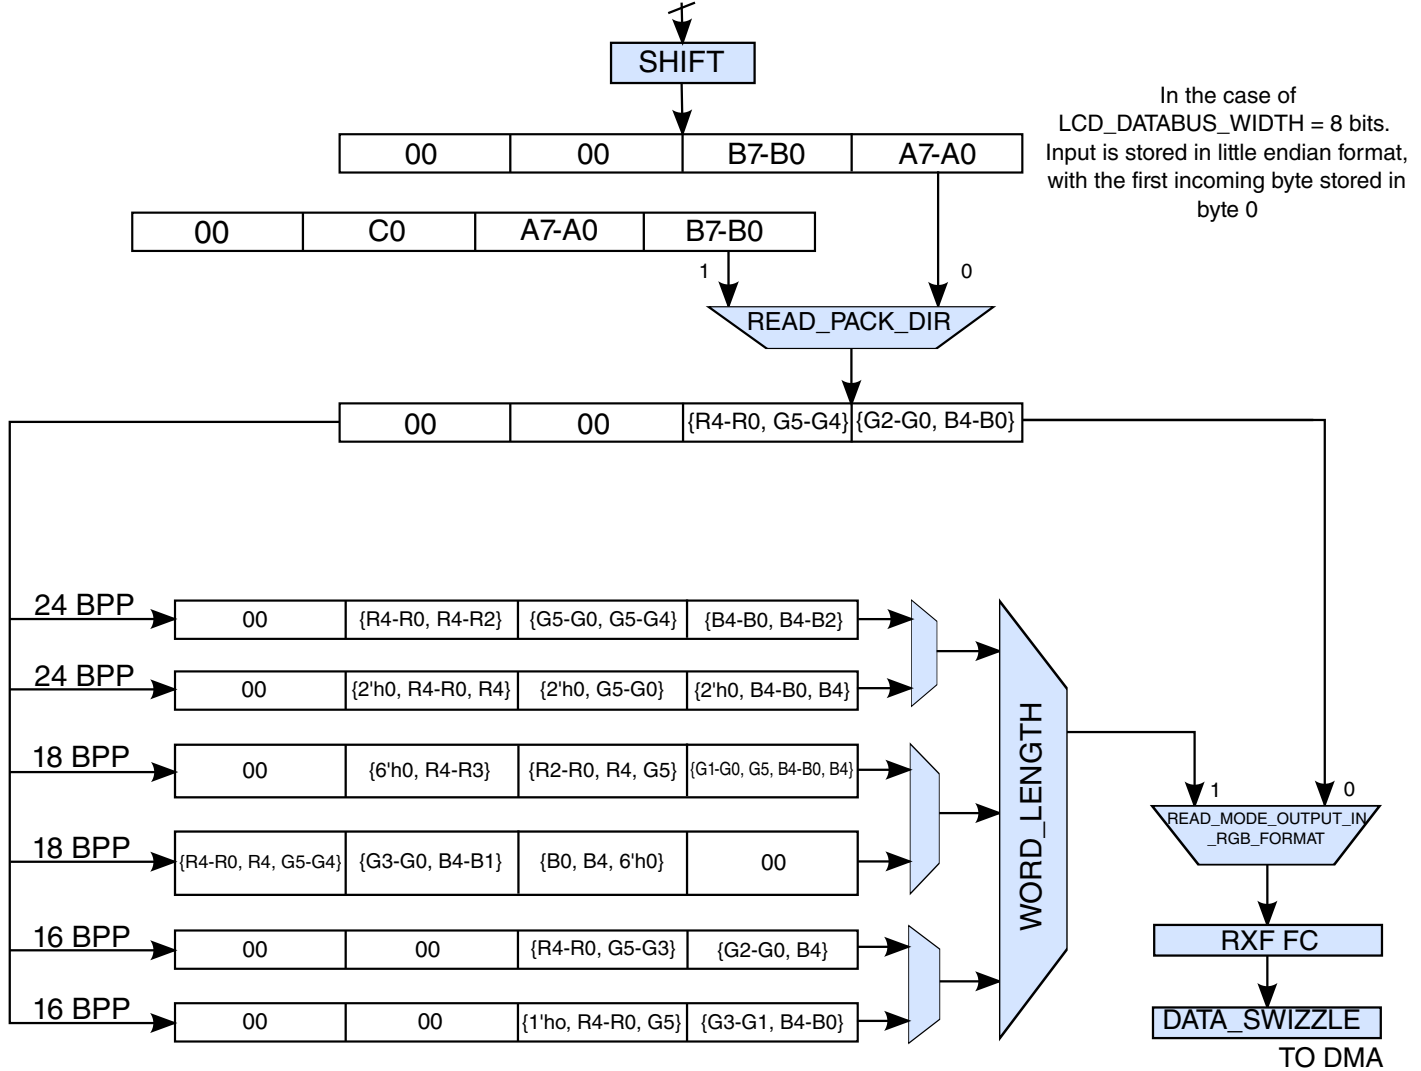

Figure 35-8. Data in MPU read mode

Functional Description

READ_MODE_NUM_PACKED_SUBWORDS = 3 AND LCD_DATABUS_WIDTH = 8 BITS
 OR
 READ_MODE_NUM_PACKED_SUBWORDS = 1 AND LCD_DATABUS_WIDTH = 24 BITS

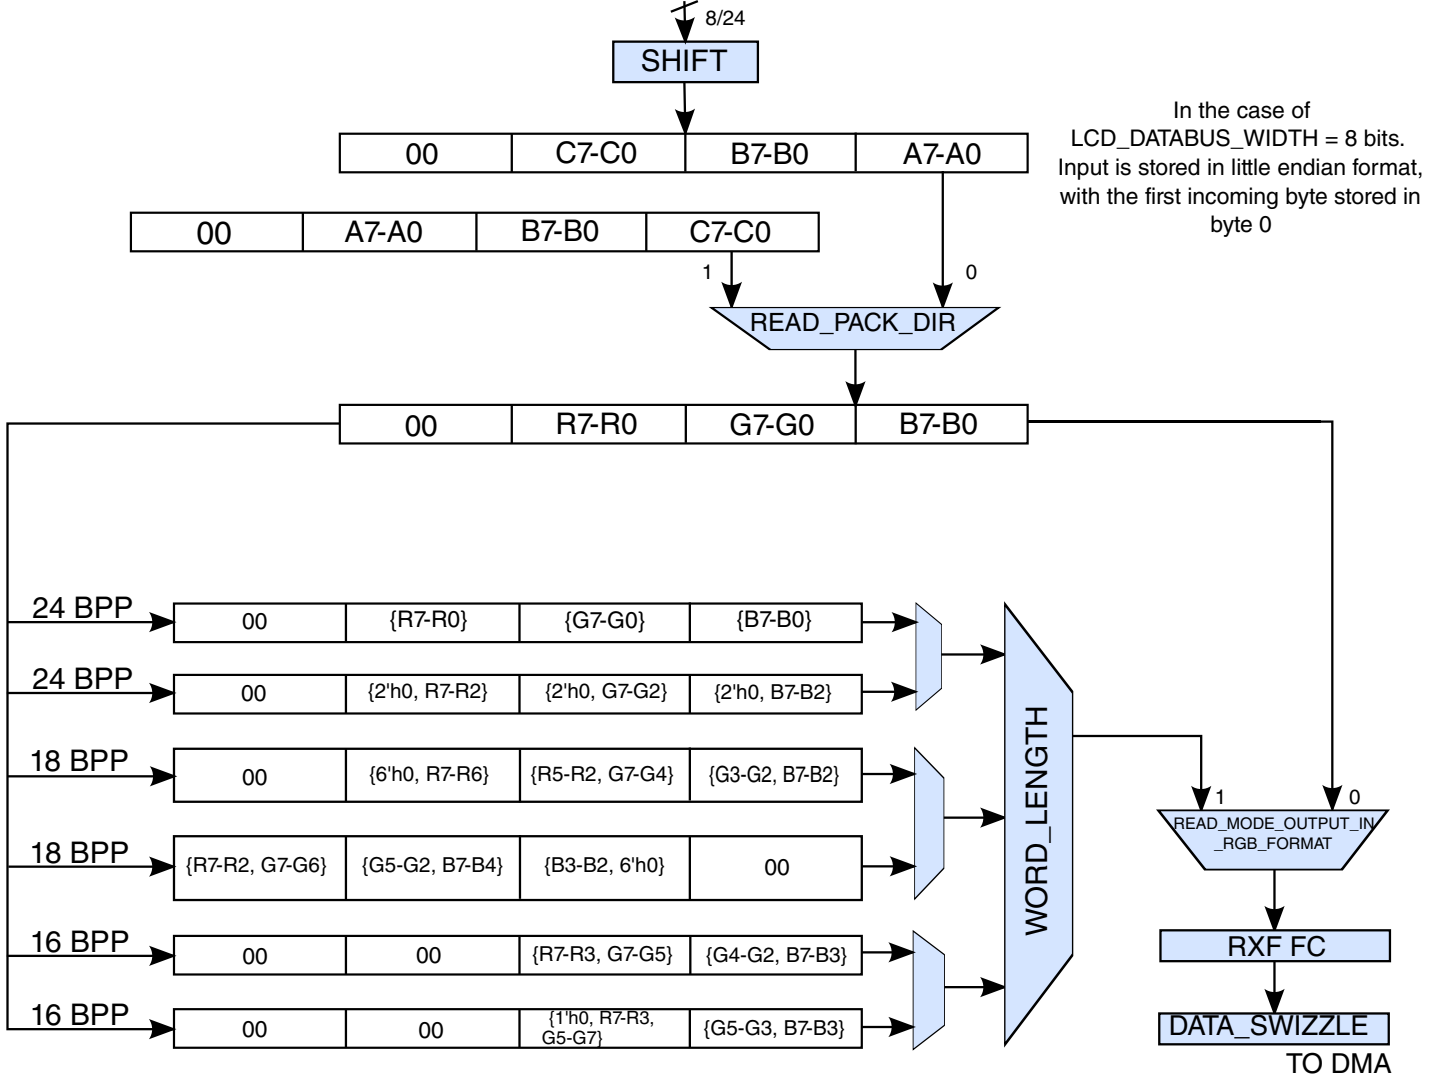

Figure 35-9. Data in MPU read mode

READ_MODE_NUM_PACKED_SUBWORDS = 1 AND LCD_DATABUS_WIDTH = 18 BITS

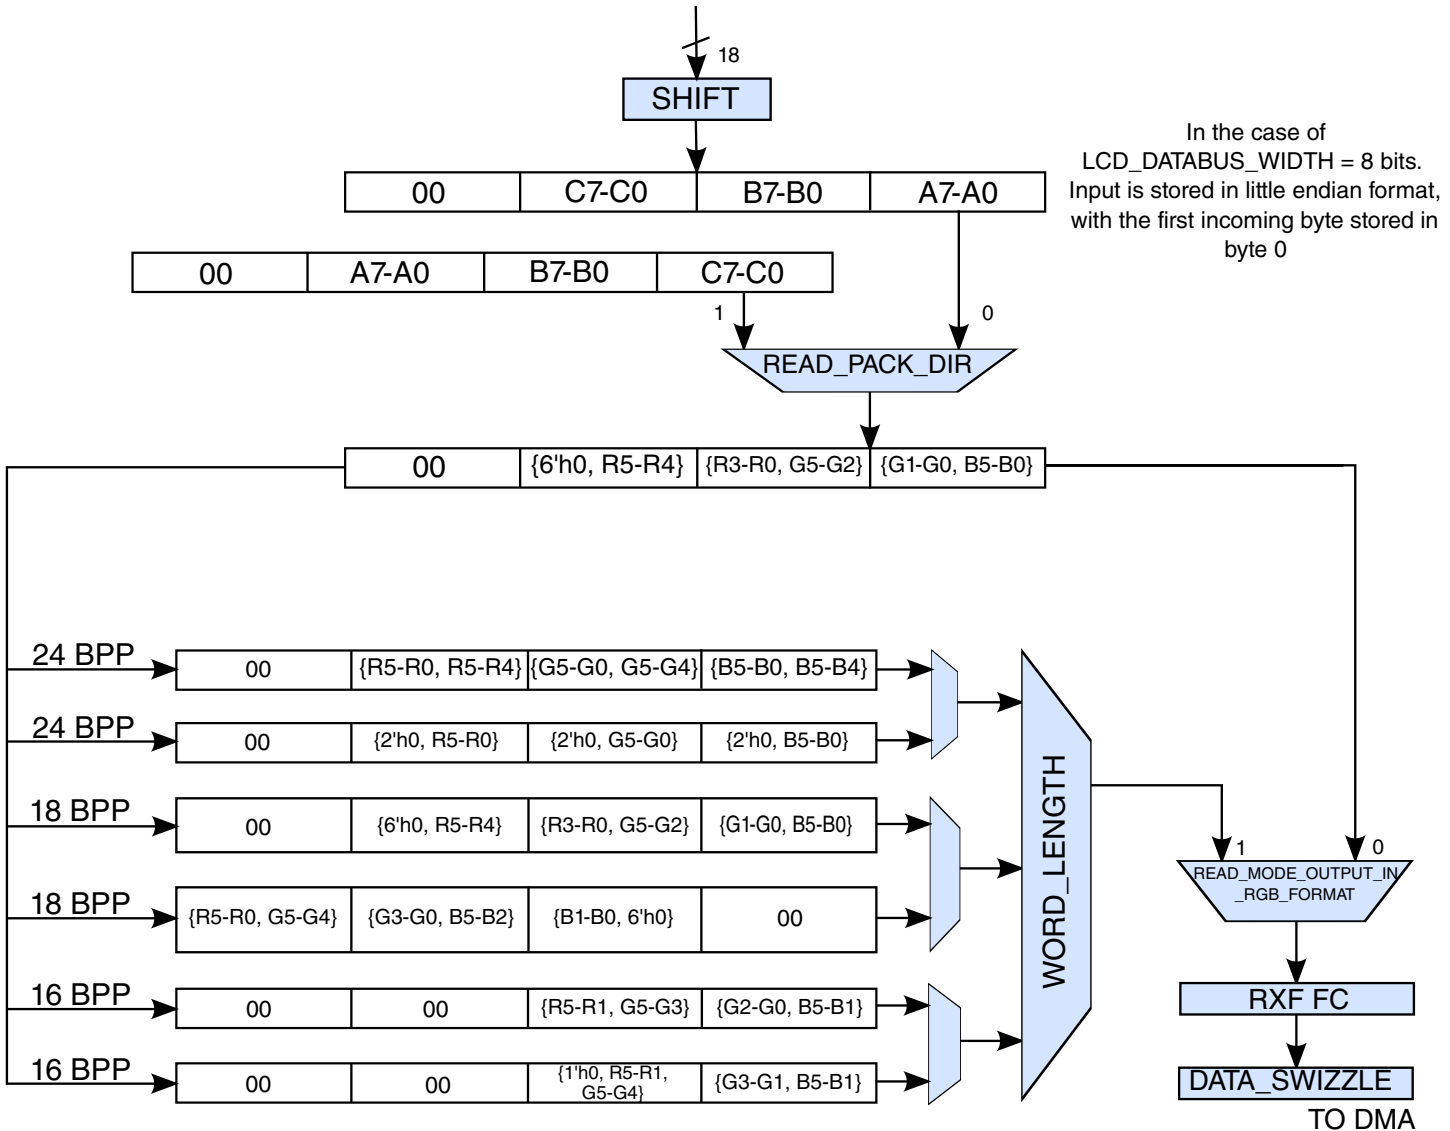

Figure 35-10. Data in MPU read mode

Restrictions:

READ_PACK_DIR should only be used if it is required to swizzle the subwords before doing RGB to RGB CSC, otherwise the DATA_SWIZZLE field should be used to swizzle across bytes.

READ_PACK_DIR must be 0 if LCD_DATABUS_WIDTH is 8 bits and READ_MODE_NUM_PACKED_SUBWORDS = 1

If READ_MODE_OUTPUT_IN_RGB_FORMAT bit is set, the following restrictions should be followed:

- If LCD_DATABUS_WIDTH = 8 bits, then
READ_MODE_NUM_PACKED_SUBWORDS <= 3.
- If LCD_DATABUS_WIDTH = 16/18/24 bits, then
READ_MODE_NUM_PACKED_SUBWORDS = 1.

35.4.4 eLCDIF Interrupts

eLCDIF supports a number of interrupts to aid controlling and status reporting of the block.

All the interrupts have individual mask bits for enabling or disabling each of them. They all get funneled through a single interrupt line connected to the interrupt collector (ICOLL).

The following list describes the different interrupts supported by eLCDIF:

- Underflow interrupt is asserted when the clock domain crossing FIFO (TXFIFO) becomes empty but the block is in active display portion during that time. Software should take corrective action to make sure that this does not happen.
- In the bus master mode, the overflow interrupt will be asserted if the block has requested more data than its FIFOs could hold. In the read mode, it will be asserted if the RxFIFO becomes full and the block reads more data.
- VSYNC edge interrupt will be asserted every time a leading VSYNC edge occurs.
- Cur_frame_done interrupt occurs at the end of every frame in all modes except DVI. In DVI mode, if IRQ_ON_ALTERNATE_FIELDS bit is set, it will occur at the end of every frame, otherwise it will occur at the end of every field.

35.4.5 Initializing the eLCDIF

This section describes write modes and MPU read mode.

35.4.5.1 Write Modes

The following initialization steps are common to all eLCDIF write modes of operation before entering any particular mode.

Initialization steps:

1. Configure the external I/Os to correctly interface the external display, when required.
2. Start the DISPLAY CLOCK (pix_clk) clock and set the appropriate frequency by programming the registers in CCM.

3. Start the BUS CLOCK (apb_clk) and set the appropriate frequency by programming the registers in CCM.
4. Bring the eLCDIF out of soft reset and disable the clock gate bit.
5. Reset the LCD controller by setting LCDIF_CTRL1[RESET] bit appropriately, being careful to observe the reset requirements of the controller. See [Behavior During Reset](#) for more information on Reset requirements.
6. Make sure LCDIF_CTRL[READ_WRITEB] bit is 0.
7. Select the transfer mode of operation. The LCDIF_CTRL[MASTER] bit determines the transfer mode selected. Bus master (LCDIF_CTRL[MASTER] =1), or PIO (LCDIF_CTRL[MASTER] =0) mode are the transfer modes to select.
8. Set the LCDIF_CTRL[INPUT_DATA_SWIZZLE] according to the endianness of the LCD controller. Also, set the LCDIF_CTRL[DATA_SHIFT_DIR] and LCDIF_CTRL[SHIFT_NUM_BITS] if it is required to shift the data left or right before it is output.
9. Set the LCDIF_CTRL[WORD_LENGTH] field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24/32-bit input. Also, select the correct 16/18/24 bit data format with the corresponding fields in LCDIF_CTRL register.
10. Set the LCDIF_CTRL1[BYTE_PACKING_FORMAT] field according to the input frame.
11. Set the LCDIF_CTRL[LCD_DATABUS_WIDTH] appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24/32-bit output.
12. Enable the necessary IRQs.

35.4.5.2 MPU Read Mode

The following initialization steps should be done to enter the MPU read mode of operation:

Initialization steps:

1. Configure the external I/Os to correctly interface the external display.
2. Start the DISPLAY CLOCK (pix_clk) and set the appropriate frequency by programming the registers in CCM.
3. Start the BUS CLOCK (apb_clk) and set the appropriate frequency by programming the registers in CCM.
4. Bring the eLCDIF out of soft reset and clock gate.
5. Reset the LCD controller by setting LCDIF_CTRL1_RESET bit appropriately, being careful to observe the reset requirements of the controller.
6. Set the READ_WRITEB bit in LCDIF_CTRL register to 1.
7. Set the LCDIF_MASTER bit in LCDIF_CTRL register to 0. Bus master mode is not supported for reading data from the display.

8. Also, set the `DATA_SHIFT_DIR` and `SHIFT_NUM_BITS` if it is required to shift the data left or right before it is output.
9. Indicate if the read data needs to be color-space-converted and stored in a different RGB format by setting the `READ_MODE_OUTPUT_IN_RGB_FORMAT` field accordingly.
10. Set the `WORD_LENGTH` field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24-bit input if `READ_MODE_OUTPUT_IN_RGB_FORMAT` is required. Also, select the correct 16/18/24 bit data format with the corresponding fields in `LCDIF_CTRL` register.
11. Set the `READ_MODE_NUM_PACKED_SUBWORDS` field in `LCDIF_CTRL2` according to the number of subwords per word required to be packed.
12. Set the `READ_PACK_DIR` to 1 if it is required to store the data in big-endian format.
13. Set the `LCD_DATABUS_WIDTH` appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24-bit output.
14. Enable the necessary IRQs.

35.4.6 MPU Interface

The MPU interface is used to transfer data and commands between the SoC via the eLCDIF and the external display at modest data rates.

Bus master or PIO transactions using the `LCDIF_DATA` register can be used for MPU mode write operations. For MPU mode read operations, only PIO can be used. eLCDIF can support the 6800 as well as the 8080 MPU protocol. If `DOTCLK_MODE`, `DVI_MODE` and `VSYNC_MODE` bits in `LCDIF_CTRL` registers are 0, it implies that the block is in MPU interface mode of operation. The LCDIF MPU mode has four basic timing parameters: Setup and Hold for the Command/Data register selection (TCS, TCH) and Setup and Hold for the Data bus (TDS, TDH). These parameters are expressed in DISPLAY CLOCK (pix_clk) cycles. The `LCD_WR` signal is used as the write strobe while `LCD_RS` signal is typically used to switch between command and data modes.

Figure 35-11. Timing in write mode of 6800 and 8080 protocols

Figure 35-12. Read timing interface in 6800 and 8080 protocols

Functional Description

The eLCDIF has flexible pin and strobe timings which enable it to optimally support a wide range of LCDs. The minimum cycle time is two DISPLAY CLOCK (pix_clk) cycles (TDS=TDH=1). For example, this results in a maximum LCD data rate of 12 MB/s when DISPLAY CLOCK (pix_clk) is 24 MHz. TDS and TDH are 8-bit values, so the minimum eLCDIF period is 510 DISPLAY CLOCK (pix_clk) cycles (47 KHz with a 24 MHz DISPLAY CLOCK (pix_clk)). The timings are not automatically adjusted if the DISPLAY CLOCK (pix_clk) frequency changes, so it may be necessary to adjust the timings if DISPLAY CLOCK (pix_clk) changes.

In the MPU interface mode, the LCDIF_CTRL_BYPASS_COUNT bit must be 0. The RUN bit is cleared automatically once the eLCDIF has received/transmitted all the data as per the LCDIF_TRANSFER_COUNT register and has completed the transfer to the panel. The current transfer can be cancelled/aborted if the RUN bit is manually made 0.

35.4.6.1 Code Example to Initialize the eLCDIF in MPU Write Mode

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1(LCDIF_CTRL, DATA_SELECT, 1); // 0 if sending command, 1 if sending data. Note that the
// idle state for LCD_RS signal is high, regardless of the
// programming of the DATA_SELECT register.
BF_CS1 (LCDIF_CTRL, MODE86, 8080_MODE);
BF_CS1 (LCDIF_CTRL, READ_WRITEB, 0);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 0); //Must be 0 in MPU mode
BF_CS1 (LCDIF_CTRL1, BUSY_ENABLE, 1); //Only if LCD controller implements a busy line
BF_CS4 (LCDIF_TIMING, CMD_HOLD, 2, CMD_SETUP, 2, DATA_HOLD, 2, DATA_SETUP, 2); //Values
based
// on DISPLAY CLOCK (pix_clk) frequency and timing requirements
of controller.
// Note that these register must be non-zero for correct
operation.
BF_CS2 (LCDIF_TRANSFER_COUNT, H_COUNT, 320, V_COUNT, 240); //For a 320 RGB x 240 display
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

The eLCDIF is now ready to receive data via bus master PIO write transactions using the LCDIF_DATA register. Note that when using the PIO write operations to the LCDIF_DATA register, the software will need to poll the FIFO STATUS bits to ensure that it does not overflow the eLCDIF data buffers. When eLCDIF is done transmitting H_COUNT x V_COUNT pixels, it will stop, turn off the RUN bit and assert the cur_frame_done interrupt.

35.4.7 VSYNC Interface

The VSYNC interface uses the same protocol as the MPU interface, with an additional signal VSYNC at the frame rate of the display, as shown in the figure given in MPU Interface section.

It is used in the moving picture display mode where data has to be written to the internal LCD buffer at a speed higher than the display rate and displayed in synchronization with the VSYNC signal. This mode is selected by setting the VSYNC_MODE bit in LCDIF_CTRL register. The VSYNC signal is programmable for period, polarity and direction. Many other programmable parameters are shared with the MPU interface. The VSYNC_OEB bit in LCDIF_VDCTRL0 register indicates whether the display controller will send the VSYNC signal, or whether it should be generated by eLCDIF. The timing of the VSYNC signal is based on the DISPLAY CLOCK (pix_clk) (make sure VSYNC_PULSE_WIDTH_UNIT = VSYNC_PERIOD_UNIT = 0 and VSYNC_ONLY = 1) and it is determined by the VSYNC_PERIOD, VSYNC_PULSE_WIDTH and VSYNC_POL fields in LCDIF_VDCTRL0-4 registers. The SYNC_SIGNALS_ON bit in LCDIF_VDCTRL4 register must be set if the target requires the VSYNC signal to be generated by eLCDIF. If the WAIT_FOR_VSYNC_EDGE bit in LCDIF_CTRL register is set, it indicates that the hardware should wait until it sees the leading VSYNC edge before starting the data transfer. The VERTICAL_WAIT_CNT indicates the number of DISPLAY CLOCK (pix_clk) cycles from the leading VSYNC edge after which data transfer will be started on the interface.

In the VSYNC interface mode, the LCDIF_CTRL_BYPASS_COUNT bit must be 0. The RUN bit is cleared automatically once the eLCDIF has received/transmitted all the data as per the LCDIF_TRANSFER_COUNT register and has completed the transfer to the panel. The current transfer can be cancelled/aborted if the RUN bit is manually made 0.

35.4.7.1 Code Example to Initialize eLCDIF in VSYNC Mode

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DATA_SELECT, 1); // 0 if sending command, 1 if sending data. Note that
//the idle state for LCD_RS signal is high, regardless of the programming of the DATA_SELECT
//register.

BF_CS1 (LCDIF_CTRL, MODE86, 8080_MODE);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 0); //Must be 0 in MPU mode
BF_CS1 (LCDIF_CTRL1, BUSY_ENABLE, 0);
BF_CS4 (LCDIF_TIMING, CMD_HOLD, 2, CMD_SETUP, 2, DATA_HOLD, 2, DATA_SETUP, 2); //Values
//based on DISPLAY CLOCK (pix_clk) frequency and timing requirements of controller. Note
that these
//register must be non-zero for the MPU and VSYNC modes.
BF_CS2 (LCDIF_TRANSFER_COUNT, H_COUNT, 320, V_COUNT, 240); //For a 320 RGB x 240 display
//The following section indicates setting up the VSYNC signal timing when VSYNC is an output
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Making VSYNC signal an output
BF_CS1 (LCDIF_VDCTRL4, VSYNC_ONLY, 1); //Only need to generate VSYNC signal
BF_CS1 (VDCTRL0, VSYNC_POL, 0); //Setting the polarity of VSYNC signal to be low during
//VSYNC_PULSE_WIDTH time
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 0, VSYNC_PULSE_WIDTH_UNIT, 0);
BF_CS2 (LCDIF_VDCTRL1, VSYNC_PERIOD, 400000, VSYNC_PULSE_WIDTH, 100); //Frame display rate in
//terms of number of DISPLAY CLOCKS (pix_clk).
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 0, HSYNC_PERIOD, 0);
BF_CS1 (LCDIF_VDCTRL3, VERTICAL_WAIT_CNT, 50);
```

Functional Description

```
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);  
BF_CS2 (LCDIF_CTRL, VSYNC_MODE, 1, WAIT_FOR_VSYNC_EDGE, 1); //set WAIT_FOR_VSYNC_EDGE if  
//software wishes to transfer the next frame after the VSYNC edge occurs.  
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

The eLCDIF is now ready to receive data via bus master requests or PIO writes to the LCDIF_DATA register. When eLCDIF is done transmitting $H_COUNT \times V_COUNT$ pixels, it will stop, turn off the RUN bit and assert the cur_frame_done interrupt.

35.4.8 DOTCLK Interface

The DOTCLK interface is another mode used in moving picture displays.

It includes the VSYNC, HSYNC, DOTCLK and (optional) ENABLE signals. The interface is popularly called the RGB interface if the ENABLE signal is present.

Figure 35-13. DOTCLK protocol with programmable parameters

The DOTCLK mode writes data at high speed to the LCD, and the display operation is synchronized with the VSYNC, HSYNC, ENABLE and DOTCLK signals. The polarities, periods and pulse-widths of the sync signals are programmable using the LCDIF_VDCTRL0-4 registers. The units for the VSYNC signal must be number of horizontal lines and can be selected using the VSYNC_PULSE_WIDTH_UNIT and VSYNC_PERIOD_UNIT bit fields. The VERTICAL_WAIT_CNT is by default given the same unit as the VSYNC_PERIOD. The DISPLAY CLOCK (pix_clk) frequency is managed by the CCM.

In DOTCLK mode, LCDIF_CTRL_BYPASS_COUNT bit must be set to 1. To end the current transfer, the software should make the DOTCLK_MODE bit 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and issue the cur_frame_done interrupt.

35.4.8.1 Code Example

The following code shows an example for programming a 320x240 display.

NOTE

Setting up the display must be done through the MPU mode or via SPI.

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DOTCLK_MODE, 1);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 1); //Always for DOTCLK mode
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Vsync is always an output in the DOTCLK mode
BF_CS4 (LCDIF_VDCTRL0, VSYNC_POL, 0, HSYNC_POL, 0, DOTCLK_POL, 0, ENABLE_POL, 0);
BF_CS1 (LCDIF_VDCTRL0, ENABLE_PRESENT, 1);
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 1, VSYNC_PULSE_WIDTH_UNIT, 1);
BF_CS1 (LCDIF_VDCTRL0, VSYNC_PULSE_WIDTH, 2);
BF_CS1 (LCDIF_VDCTRL1, VSYNC_PERIOD, 280);
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 10, HSYNC_PERIOD, 360); //Assuming
// LCD_DATABUS_WIDTH is 24bit
BF_CS2 (LCDIF_VDCTRL3, VSYNC_ONLY, 0);
BF_CS2 (LCDIF_VDCTRL3, HORIZONTAL_WAIT_CNT, 20, VERTICAL_WAIT_CNT, 20);
BF_CS1 (LCDIF_VDCTRL4, DOTCLK_H_VALID_DATA_CNT, 320); //Note that DOTCLK_V_VALID_DATA_CNT is
//implicitly assumed to be HW_LCDIF_TRANSFER_COUNT_V_COUNT
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

To stop the transfer completely, the ideal way is to make DOTCLK_MODE = 0. In that case, the block will transmit the contents in the FIFO and reset the RUN bit.

35.4.9 CSI HANDSHAKE INTERFACE

The LCDIF and CSI support a pipeline mode to use double buffers inside OCRAM for the video pass through from CSI to LCDIF, the pipeline buffer size can be 8 line or 16 line as configurable. The pipeline will be handle by hardware handshake signals between CSI and LCDIF. The LCDIF will have the capability to synchronize display with CSI based on the VSYNC signal from CSI. When LCDIF is enabled to start display, it can optionally wait for the VSYNC edge from CSI before it starts the display for next frame, The delay from VSYNC input to the start of next frame is programmable by LCDIF_SYNC_DELAY register.

Figure 35-14. CSI HandShake Interface

When this mode is enabled, the hardware handshake protocol will process. At the start of CSI with camera input, the CSI will put the input data to one frame buffer. When the frame buffer is ready for LCDIF display, CSI will assert `csi_ready` signal to indicate LCDIF to read the buffer and LCDIF will display data in this buffer. When one frame buffer reading finished, LCDIF will set the `lcdif_done` signal to indicate CSI this buffer has been displayed and can be written again. With this double buffer handshake mode, the LCDIF can display the video input within very short delay and minimize DRAM bandwidth.

35.4.10 Alpha Blending Interface

The LCDIF has the capability to add an extra overlay on the normal display buffer. LCDIF can fetch data from two buffers and combine them before display, one buffer data can have the alpha value with the RGB pixels. With `LCDIF_AS_CTRL[AS_ENABLE]` is set, the LCDIF will start fetching alpha surface buffer data in bus master mode and combine it with another buffer.

The `LCDIF_AS_CTRL[ALPHA_CTRL]` bits determine how the alpha value is constructed for the alpha surface and alpha blending process is as same as in PXP block, for the alpha blend and color key process refer to the PXP block descriptions.

35.4.11 ITU-R BT.656 Digital Video Interface (DVI)

ITU-R BT.656 Digital Video Interface shown below transmits 4:2:2 YCbCr digital component video to a digital video encoder that can translate it into 525/60 or 625/50 analog TV signal.

Unique timing codes (timing reference signals) are embedded within the video stream to indicate the different timing events that would have been otherwise indicated by VSYNC, HSYNC and BLANK signals. The hardware supports 8-bit data transfers; the pins are shared with the lower 8 bits of LCD data bus. The LCD_RS pin is shared with the clock signal of the interface (called CCIRCLK here for uniqueness). CCIRCLK also can be obtained on the LCD_DOTCLK pin. The mode shares the write FIFO with the LCD interface and the associated pipeline. The programmable parameters in registers LCDIF_DVICTRL0-3 allow setting the total number of horizontal lines per frame, vertical and horizontal blanking interval, odd and even field start and end positions, and so on. In short, these parameters are provided to ensure that the hardware has enough flexibility to generate the right 525/60 or 625/50 data streams. Most of the initialization steps in [Initializing the eLCDIF](#) such as data shifting, swizzle, and so on, are applicable to DVI mode also. The register descriptions in the programmable registers section at the end of this chapter include example code for programming the DVICTRL0-3 registers.

In DVI mode, LCDIF_CTRL_BYPASS_COUNT bit must be set to 1. To end the current transfer, the software should make the DVI_MODE bit the value 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and assert the cur_frame_done interrupt.

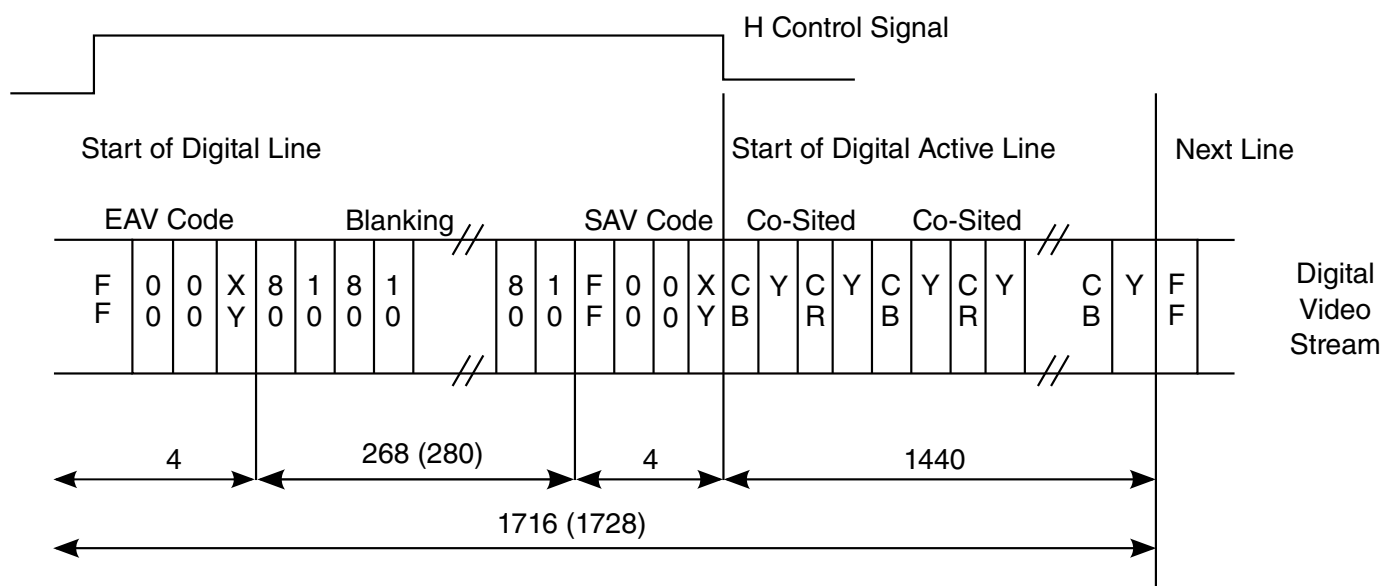

Figure 35-15. Digital Video Interface

35.4.12 eLCDIF Pin Usage by Interface Mode

The following tables detail how the eLCDIF level interface pins are used based on the desired mode of operation. The chip level I/Os should also be configured to be consistent with the desired eLCDIF operating mode.

The VSYNC signal has been mapped onto two pins, LCD_BUSY and LCD_VSYNC. The pin multiplexing can be programmed to select either of those pins to function as VSYN.

NOTE

There is an option to internally mux the HSYNC, DOTCLK and ENABLE signals in the DOTCLK mode by setting the MUX_SYNC_SIGNALS bit in the VDCTRL0 register.

35.5 Behavior During Reset

BUS CLOCK (apb_clk) and DISPLAY CLOCK (pix_clk) must be running before making any changes to SFTRST or CLKGATE bits.

A soft reset (SFTRST) can take multiple clock periods to complete, so do not set CLKGATE when setting SFTRST.

The reset process gates the clocks automatically.

35.6 ELCDIF Memory Map/Register Definition

Some of the LCDIF registers (XXX_SET, XXX_CLR, and XXX_TOG) allow direct bit field masking and access.

- When writing 1 to XXX_SET bit fields, these registers allow setting the masked 1 bit fields, while keeping unchanged all bit fields which remain on 0 logic state.
- When writing 1 to XXX_CLR bit fields, these registers allow clearing the masked 1 bit fields, while keeping unchanged all other bit fields which remained on 0 logic state.
- When writing 1 to XXX_TOG bit fields, these registers allow inverting the logic state of all masked 1 bit fields, while they keep unchanged the remaining bit fields which were kept on 0 logic state.

eLCDIF Hardware Register Format Summary

LCDIF memory map

35.6.1 eLCDIF General Control Register (LCDIF_CTRLn)

The LCD Interface Control Register provides overall control of the eLCDIF block. The eLCDIF Control Register provides a variety of control functions to the programmer. These functions allow the interface to be very flexible to work with a variety of LCD controllers, and to minimize overhead and increase performance of LCD programming. The register has been organized such that switching between the different LCD modes can be done with minimum PIO writes.

Address: 21C_8000h base + 0h offset + (4d × i), where i=0d to 3d

LCDIF_CTRLn field descriptions

Field	Description
31 SFTRST	This bit must be set to zero to enable normal operation of the eLCDIF. When set to one, it forces a block level reset.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 YBCR422_INPUT	Zero implies input data is in RGB color space. One implies input data is in YCbCr 4:2:2 format, such that YCbCr are packed in a 32-bit word. It also means that there are 2 pixels in 4 bytes. If this bit is set, software should program the H_COUNT field in the TRANSFER_COUNT register to the total number of pixels that will have to be fetched by the eLCDIF block per line and the BYTE_PACKING_FORMAT should be 0xF. The WORD_LENGTH does not matter in this case.

Table continues on the next page...

LCDIF_CTRLn field descriptions (continued)

Field	Description
28 READ_WRITEB	By default, eLCDIF is in the write mode. Setting this bit to 1 will make the hardware go into 6800/8080 MPU read mode. The LCDIF_MASTER bit must be 0, since bus master mode can only be used for writing the display.
27 WAIT_FOR_VSYNC_EDGE	Setting this bit to 1 will make the hardware wait for the triggering VSYNC edge before starting write transfers to the LCD. Used only in the VSYNC mode of operation.
26 DATA_SHIFT_DIR	Use this bit to determine the direction of shift of transmit data. In the DVI mode, it works only on the active data, not on the timing codes and ancillary data. 0x0 TXDATA_SHIFT_LEFT — Data to be transmitted is shifted LEFT by SHIFT_NUM_BITS bits. 0x1 TXDATA_SHIFT_RIGHT — Data to be transmitted is shifted RIGHT by SHIFT_NUM_BITS bits.
25–21 SHIFT_NUM_BITS	The data to be transmitted is shifted left or right by this number of bits.
20 DVI_MODE	Set this bit to 1 to get into the ITU-R BT.656 digital video interface mode. Toggle this bit from 1 to 0 to make the hardware go out of DVI mode after completing all data transfer and after the RUN bit has been deasserted.
19 BYPASS_COUNT	When this bit is 0, it means that eLCDIF will stop the block operation and turn off the RUN bit after the amount of data indicated by the LCDIF_TRANSFER_COUNT register has been transferred out. When this bit is set to 1, the block will continue normal operation indefinitely until it is told to stop. This bit must be 0 in MPU and VSYNC modes, and must be 1 in DOTCLK and DVI modes of operation.
18 VSYNC_MODE	Setting this bit to 1 will make the eLCDIF hardware go into VSYNC mode. WAIT_FOR_VSYNC_EDGE can be used only if this bit is set. If VSYNC signal is required to be an output from the block, SYNC_SIGNALS_ON bit in LCDIF_VDCTRL4 register must be set.
17 DOTCLK_MODE	Set this bit to 1 to make the hardware go into the DOTCLK mode, i.e. VSYNC/HSYNC/DOTCLK/ENABLE interface mode. ENABLE is optional, selected by the ENABLE_PRESENT bit. Toggle this bit from 1 to 0 to make the hardware go out of DOTCLK mode after completing all data transfer and deasserting the RUN bit.
16 DATA_SELECT	Command Mode polarity bit. This bit should only be changed when RUN is 0. 0x0 CMD_MODE — Command Mode. LCD_RS signal is Low. 0x1 DATA_MODE — Data Mode. LCD_RS signal is High.
15–14 INPUT_DATA_SWIZZLE	This field specifies how to swap the bytes fetched by the bus master interface. The swizzle function is independent of the WORD_LENGTH bit. The supported swizzle configurations are: 0x0 NO_SWAP — No byte swapping.(Little endian) 0x0 LITTLE_ENDIAN — Little Endian byte ordering (same as NO_SWAP). 0x1 BIG_ENDIAN_SWAP — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 SWAP_ALL_BYTES — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 HWD_SWAP — Swap half-words. 0x3 HWD_BYTE_SWAP — Swap bytes within each half-word.
13–12 CSC_DATA_SWIZZLE	This field specifies how to swap the bytes after the data has been converted into an internal representation of 24 bits per pixel and before it is transmitted over the LCD interface bus. The data is always transmitted with the least significant byte/hword (half word) first after the swizzle takes place. So, INPUT_DATA_SWIZZLE takes place first on the incoming data, and then CSC_DATA_SWIZZLE is applied. The swizzle function is independent of the WORD_LENGTH or the LCD_DATABUS_WIDTH fields. If RGB_TO_YCRCB422_CSC bit is set, the swizzle occurs on the Y, Cb, Cr values. The supported swizzle configurations are: 0x0 NO_SWAP — No byte swapping.(Little endian)

Table continues on the next page...

LCDIF_CTRLn field descriptions (continued)

Field	Description
	0x0 LITTLE_ENDIAN — Little Endian byte ordering (same as NO_SWAP). 0x1 BIG_ENDIAN_SWAP — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 SWAP_ALL_BYTES — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 HWD_SWAP — Swap half-words. 0x3 HWD_BYTE_SWAP — Swap bytes within each half-word.
11–10 LCD_DATABUS_WIDTH	LCD Data bus transfer width. 0x0 16_BIT — 16-bit data bus mode. 0x1 8_BIT — 8-bit data bus mode. 0x2 18_BIT — 18-bit data bus mode. 0x3 24_BIT — 24-bit data bus mode.
9–8 WORD_LENGTH	Input data format. 0x0 16_BIT — Input data is 16 bits per pixel. 0x1 8_BIT — Input data is 8 bits wide. 0x2 18_BIT — Input data is 18 bits per pixel. 0x3 24_BIT — Input data is 24 bits per pixel.
7 RGB_TO_YCBCR422_CSC	Set this bit to 1 to enable conversion from RGB to YCbCr colorspace. See the LCDIF_CSC_ registers for further details.
6 ENABLE_PXP_HANDSHAKE	If this bit is set and LCDIF_MASTER bit is set, the eLCDIF will act as bus master and the handshake mechanism between eLCDIF and PXP will be turned on. If LCDIF_MASTER bit is not set, this bit becomes a don't care.
5 MASTER	Set this bit to make the eLCDIF act as a bus master.
4 RSRVD0	This field is reserved. Reserved bits. Write as 0.
3 DATA_FORMAT_16_BIT	When this bit is 1 and WORD_LENGTH = 0, it implies that the 16-bit data is in ARGB555 format. When this bit is 0 and WORD_LENGTH = 0, it implies that the 16-bit data is in RGB565 format. When WORD_LENGTH is not 0, this bit does not care.
2 DATA_FORMAT_18_BIT	Used only when WORD_LENGTH = 2, i.e. 18-bit. 0x0 LOWER_18_BITS_VALID — Data input to the block is in 18 bpp format, such that lower 18 bits contain RGB 666 and upper 14 bits do not contain any useful data. 0x1 UPPER_18_BITS_VALID — Data input to the block is in 18 bpp format, such that upper 18 bits contain RGB 666 and lower 14 bits do not contain any useful data.
1 DATA_FORMAT_24_BIT	Used only when WORD_LENGTH = 3, i.e. 24-bit. Note that this applies to both packed and unpacked 24-bit data. 0x0 ALL_24_BITS_VALID — Data input to the block is in 24 bpp format, such that all RGB 888 data is contained in 24 bits. 0x1 DROP_UPPER_2_BITS_PER_BYTE — Data input to the block is actually RGB 18 bpp, but there is 1 color per byte, hence the upper 2 bits in each byte do not contain any useful data, and should be dropped.
0 RUN	When this bit is set by software, the eLCDIF will begin transferring data between the SoC and the display. This bit must remain set until the operation is complete.

35.6.2 eLCDIF General Control1 Register (LCDIF_CTRL1n)

The eLCDIF Control Register provides overall control of the eLCDIF block.

The eLCDIF Control1 Register provides additional programming to the eLCDIF. It implements some bits which are unlikely to change often in a particular application. It also carries interrupt-related bits which are common across more than one mode of operation.

Address: 21C_8000h base + 10h offset + (4d × i), where i=0d to 3d

LCDIF_CTRL1n field descriptions

Field	Description
31–28 RSRVD1	This field is reserved. Reserved bits. Write as 0.
27 COMBINE_MPU_WR_STRB	If this bit is not set, the write strobe will be driven on LCD_WR_RWn pin in the 8080 mode and on the LCD_RD_E pin in the 6800 mode. If it is set, the write strobe of both the 6800 and 8080 modes will be driven only on the LCD_WR_RWn pin. Note that this does not work for read strobe.
26 BM_ERROR_IRQ_EN	This bit is set to enable bus master error interrupt in the eLCDIF master mode.
25 BM_ERROR_IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. This bit will be set when the eLCDIF is in master mode and an error response was returned by the slave.

Table continues on the next page...

LCDIF_CTRL1n field descriptions (continued)

Field	Description
	0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.
24 RECOVER_ON_ UNDERFLOW	Set this bit to enable the eLCDIF block to recover in the next field/frame if there was an underflow in the current field/frame.
23 INTERLACE_ FIELDS	Set this bit if it is required that the eLCDIF block fetches odd lines in one field and even lines in the other field. It will work only in LCDIF_MASTER is set to 1.
22 START_ INTERLACE_ FROM_ SECOND_FIELD	The default is to grab the odd lines first and then the even lines. Set this bit if it is required to grab the even lines first and then the odd lines. (Line numbers start from 1, so odd lines are 1,3,5,etc. and even lines are 2,4,6, etc.)
21 FIFO_CLEAR	Set this bit to clear all the data in the latency FIFO (LFIFO), TXFIFO and the RXFIFO.
20 IRQ_ON_ ALTERNATE_ FIELDS	If this bit is set, the eLCDIF block will assert the cur_frame_done interrupt only on alternate fields, otherwise it will issue the interrupt on both odd and even field. This bit is mostly relevant if INTERLACE_FIELDS is set.
19–16 BYTE_ PACKING_ FORMAT	This bitfield is used to show which data bytes in a 32-bit word are valid. Default value 0xf indicates that all bytes are valid. For 8-bit transfers, any combination in this bitfield will mean valid data is present in the corresponding bytes. In the 16-bit mode, a 16-bit half-word is valid only if adjacent bits [1:0] or [3:2] or both are 1. A value of 0x0 will mean that none of the bytes are valid and should not be used. For example, set the bit field value to 0x7 if the display data is arranged in the 24-bit unpacked format (A-R-G-B where A value does not have to be transmitted). When input data is in YCbCr 4:2:2 format (YCBCR422_INPUT is 1), H_COUNT should be the number of pixels that should be fetched by the block and the BYTE_PACKING_FORMAT should be 0xF. (Note - YCBCR422_INPUT = 1 implies 2 pixels per 32 bits).
15 OVERFLOW_ IRQ_EN	This bit is set to enable an overflow interrupt in the TXFIFO in the write mode.
14 UNDERFLOW_ IRQ_EN	This bit is set to enable an underflow interrupt in the TXFIFO in the write mode.
13 CUR_FRAME_ DONE_IRQ_EN	This bit is set to 1 enable an interrupt every time the hardware enters in the vertical blanking state.
12 VSYNC_EDGE_ IRQ_EN	This bit is set to enable an interrupt every time the hardware encounters the leading VSYNC edge in the VSYNC and DOTCLK modes, or the beginning of every field in DVI mode.
11 OVERFLOW_ IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A latency FIFO (LFIFO) overflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected, data samples have been lost. 0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.
10 UNDERFLOW_ IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A TXFIFO underflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected. Could produce an error in the DOTCLK / DVI modes.

Table continues on the next page...

LCDIF_CTRL1n field descriptions (continued)

Field	Description
	0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.
9 CUR_FRAME_ DONE_IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It indicates that the hardware has completed transmitting the current frame and is in the vertical blanking period in the DOTCLK/DVI modes. In the MPU and VSYNC modes, this IRQ is asserted at the end of the data transfer indicated by LCDIF_TRANSFER_COUNT register. 0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.
8 VSYNC_EDGE_ IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It is set whenever the leading VSYNC edge is detected in the VSYNC and DOTCLK modes. In the DVI mode, it is asserted every time the block enters a new field. 0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.
7–3 RSRVD0	This field is reserved. Reserved bits. Write as 0.
2 BUSY_ENABLE	This bit enables the use of the interface's busy signal input. This should be enabled for LCD controllers that implement a busy line (to stall the eLCDIF from sending more data until ready). Otherwise this bit should be cleared. 0x0 BUSY_DISABLED — The busy signal from the LCD controller will be ignored. 0x1 BUSY_ENABLED — Enable the use of the busy signal from the LCD controller.
1 MODE86	This bit is used to select between the 8080 and 6800 series of microprocessor modes. This bit should only be changed when RUN is 0. 0x0 8080_MODE — Pins LCD_WR_RWn and LCD_RD_E function as active low WR and active low RD signals respectively. 0x1 6800_MODE — Pins LCD_WR_RWn and LCD_RD_E function as Read/Write and active high Enable signals respectively.
0 RESET	Reset bit for the external LCD controller. This bit can be changed at any time. It CANNOT be reset by SFTRST. 0x0 LCDRESET_LOW — LCD_RESET output signal is low. 0x1 LCDRESET_HIGH — LCD_RESET output signal is high.

35.6.3 eLCDIF General Control2 Register (LCDIF_CTRL2n)

The eLCDIF Control Register provides overall control of the eLCDIF block.

The eLCDIF Control2 Register provides additional programming to the eLCDIF. It implements some bits which are unlikely to change often in a particular application.

LCDIF_CTRL2n field descriptions

Field	Description
31–24 RSRVD5	This field is reserved. Reserved bits. Write as 0.
23–21 OUTSTANDING_ REQS	This bitfield indicates the maximum number of outstanding transactions that eLCDIF should request when it is acting as a bus master. Default is 2 outstanding transactions. 0x0 REQ_1 — 0x1 REQ_2 — 0x2 REQ_4 — 0x3 REQ_8 — 0x4 REQ_16 —
20 BURST_LEN_8	By default, when the eLCDIF is in the bus master mode, it will issue AXI bursts of length 16 (except when in packed 24 bpp mode, it will issue bursts of length 15). When this bit is set to 1, the block will issue bursts of length 8 (except when in packed 24 bpp mode, it will issue bursts of length 9). Note that this bitfield is only applicable when LCDIF_MASTER is set to 1.
19 RSRVD4	This field is reserved. Reserved bits. Write as 0.
18–16 ODD_LINE_ PATTERN	This field determines the order of the RGB components of each pixel in ODD lines (line numbers 1,3,5,...). This bitfield must be 0 in DVI mode. 0x0 RGB — 0x1 RBG — 0x2 GBR — 0x3 GRB —

Table continues on the next page...

LCDIF_CTRL2n field descriptions (continued)

Field	Description
	0x4 BRG — 0x5 BGR —
15 RSRVD3	This field is reserved. Reserved bits. Write as 0.
14–12 EVEN_LINE_ PATTERN	This field determines the order of the RGB components of each pixel in EVEN lines (line numbers 2,4,6,...). This bitfield must be 0 in DVI mode. 0x0 RGB — 0x1 RBG — 0x2 GBR — 0x3 GRB — 0x4 BRG — 0x5 BGR —
11 RSRVD2	This field is reserved. Reserved bits. Write as 0.
10 READ_PACK_DIR	The default value of 0 indicates data is stored in the little endian format. When LCD_DATABUS_WIDTH is 8-bit, this bit provides the option of rearranging the data byte-wise in the big endian format. For example, if READ_MODE_NUM_PACKED_SUBWORDS = 3 and the order of incoming data is 0x11, 0x22 and 0x33, then setting this bit to 1 will cause the data to be stored as 0x00112233 as opposed to the default 0x00332211. This operation occurs after the shifting operation done by SHIFT_NUM_BITS bitfield.
9 READ_MODE_ OUTPUT_IN_ RGB_FORMAT	Setting this bit will enable the eLCDIF to convert the incoming data to the RGB format given by WORD_LENGTH bitfield. This feature is not available when WORD_LENGTH is set to 8 bits. eLCDIF performs this operation of converting to RGB format after the endianness has been determined by the READ_PACK_DIR bitfield.
8 READ_MODE_6_ BIT_INPUT	Setting this bit to 1 indicates to eLCDIF that even though LCD_DATABUS_WIDTH is set to 8 bits, the input data is actually only 6 bits wide and exists on D5-D0.
7 RSRVD1	This field is reserved. Reserved bits. Write as 0.
6–4 READ_MODE_ NUM_PACKED_ SUBWORDS	Indicates the number of valid 8/16/18/24-bit subwords that will be packed into the 32-bit word in read mode. The subword size (8, 16, 18 or 24 bits) is determined by the LCD_DATABUS_WIDTH field. The swizzle operation is performed after READ_MODE_NUM_PACKED_SUBWORDS number of subwords has been received and stored in little-endian format. For example, if LCD_DATABUS_WIDTH is set to 8-bit and data to be read back has to be stored in memory in 24-bit unpacked RGB format, set READ_MODE_NUM_PACKED_SUBWORDS to 0x3 so that each 32-bit word will contain only 3 valid bytes (RGB). Maximum value of READ_MODE_NUM_PACKED_SUBWORDS is 4 for 8-bit databus, 2 for 16-bit databus and 1 for 18/24-bit databus.
3–1 INITIAL_DUMMY_ READ	The value in this field determines the number of dummy 8/16/18/24-bit subwords that have to be read back from the LCD panel/controller. They will then not be stored in the read FIFO.
0 RSRVD0	This field is reserved. Reserved bits. Write as 0.

35.6.4 eLCDIF Horizontal and Vertical Valid Data Count Register (LCDIF_TRANSFER_COUNT)

This register tells the eLCDIF how much data will be sent for this frame, or transaction. The total number of words is a product of the V_COUNT and H_COUNT fields. The word size is specified by the WORD_LENGTH field.

This register gives the dimensions of the input frame. For normal operation, but V_COUNT and H_COUNT should be non-zero.

Address: 21C_8000h base + 30h offset = 21C_8030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_TRANSFER_COUNT field descriptions

Field	Description
31–16 V_COUNT	Number of horizontal lines per frame which contain valid data. In DOTCLK mode, V_COUNT should be the same as the number of active horizontal lines in a progressive frame. In DVI mode, V_COUNT should be the number of active horizontal lines per frame, and not per field.
H_COUNT	Total valid data (pixels) in each horizontal line. The data size is given by the WORD_LENGTH. When input data is in YCbCr 4:2:2 format (YCBCR422_INPUT is 1), H_COUNT should be the number of 32-bit words that should be fetched by the block and the BYTE_PACKING_FORMAT should be 0xF. In 24-bit packed format (WORD_LENGTH=0x3, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 4 pixels. In 16-bit packed format (WORD_LENGTH=0x0, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 2 pixels.

35.6.5 LCD Interface Current Buffer Address Register (LCDIF_CUR_BUF)

This register indicates the address of the current frame being transmitted by eLCDIF.

When the eLCDIF is behaving as a master, this address points to the address of the current frame of data being sent out via the LCDIF. When the current frame is done, the LCDIF block will assert the cur_frame_done interrupt for software to take action. The block will also copy the LCDIF_NEXT_BUF_ADDR into this bitfield so that the software can program the next frame address into the LCDIF_NEXT_BUF_ADDR bitfield. This address must always be double-word aligned.

Address: 21C_8000h base + 40h offset = 21C_8040h

LCDIF_CUR_BUF field descriptions

Field	Description
ADDR	Address of the current frame being transmitted by eLCDIF.

35.6.6 LCD Interface Next Buffer Address Register (LCDIF_NEXT_BUF)

This register indicates the address of next frame that will be transmitted by eLCDIF.

When the eLCDIF is behaving as a master, this address points to the address of the next frame of data that will be sent out via the eLCDIF. It is up to the software to make sure that this register is programmed before the end of the current frame, otherwise it might result in old data going out the eLCDIF. This address must always be double-word aligned.

Address: 21C_8000h base + 50h offset = 21C_8050h

LCDIF_NEXT_BUF field descriptions

Field	Description
ADDR	Address of the next frame that will be transmitted by eLCDIF.

35.6.7 LCD Interface Timing Register (LCDIF_TIMING)

The LCD interface timing register controls the various setup and hold times enforced by the LCD interface in the 6800/8080 MPU and VSYNC modes of operation.

The values used in this register are dependent on the particular LCD controller used, consult the users manual for the particular controller for required timings. Each field of the register must be non-zero, therefore the minimum value is: 0x01010101. NOTE: the timings are not automatically adjusted if the DISPLAY CLOCK (pix_clk) frequency changes—it may be necessary to adjust the timings if DISPLAY CLOCK (pix_clk)

ELCDIF Memory Map/Register Definition

changes. NOTE: Each field in this register must be non-zero for the MPU and VSYNC modes to function. The settings in this register do not affect the DOTCLK and DVI modes.

Address: 21C_8000h base + 60h offset = 21C_8060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	CMD_HOLD								CMD_SETUP								DATA_HOLD								DATA_SETUP

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_TIMING field descriptions

Field	Description
31–24 CMD_HOLD	Number of DISPLAY CLOCK (pix_clk) cycles that the LCD_RS signal is active after LCD_CS is deasserted.
23–16 CMD_SETUP	Number of DISPLAY CLOCK (pix_clk) cycles that the LCD_RS signal is active before LCD_CS is asserted.
15–8 DATA_HOLD	Data bus hold time in DISPLAY CLOCK (pix_clk) cycles. Also the time that the data strobe is deasserted in a cycle
DATA_SETUP	Data bus setup time in DISPLAY CLOCK (pix_clk) cycles. Also the time that the data strobe is asserted in a cycle.

35.6.8 eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF_VDCTRL0n)

This register is used to control the VSYNC and DOTCLK modes of the LCDIF so as to work with different types of LCDs like moving picture displays and delta pixel displays.

This register gives general programmability to the VSYNC signal including polarity, direction, pulse width, etc.

Address: 21C_8000h base + 70h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved		VSYNC_OEB	ENABLE_PRESENT	VSYNC_POL	HSYNC_POL	DOTCLK_POL	ENABLE_POL	Reserved		VSYNC_PERIOD_UNIT	VSYNC_PULSE_WIDTH_UNIT	HALF_LINE	HALF_LINE_MODE	VSYNC_PULSE_WIDTH	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_VDCTRL0n field descriptions

Field	Description
31–30 RSRVD2	This field is reserved. Reserved bits. Write as 0.
29 VSYNC_OEB	0 means the VSYNC signal is an output, 1 means it is an input. Should be set to 0 in the DOTCLK mode. 0x0 VSYNC_OUTPUT — The VSYNC pin is in the output mode and the VSYNC signal has to be generated by the eLCDIF block. 0x1 VSYNC_INPUT — The VSYNC pin is in the input mode and the LCD controller sends the VSYNC signal to the block.
28 ENABLE_PRESENT	Setting this bit to 1 will make the hardware generate the ENABLE signal in the DOTCLK mode, thereby making it the true RGB interface along with the remaining three signals VSYNC, HSYNC and DOTCLK.
27 VSYNC_POL	Default 0 active low during VSYNC_PULSE_WIDTH time and will be high during the rest of the VSYNC period. Set it to 1 to invert the polarity.
26 HSYNC_POL	Default 0 active low during HSYNC_PULSE_WIDTH time and will be high during the rest of the HSYNC period. Set it to 1 to invert the polarity.
25 DOTCLK_POL	Default is data launched at negative edge of DOTCLK and captured at positive edge. Set it to 1 to invert the polarity. Set it to 0 in DVI mode.
24 ENABLE_POL	Default 0 active low during valid data transfer on each horizontal line.
23–22 RSRVD1	This field is reserved. Reserved bits. Write as 0.
21 VSYNC_PERIOD_UNIT	Default 0 for counting VSYNC_PERIOD in terms of DISPLAY CLOCK (pix_clk) cycles. Set it to 1 to count in terms of complete horizontal lines. DISPLAY CLOCK (pix_clk) cycles should be used in the VSYNC mode, while horizontal line should be used in the DOTCLK mode.
20 VSYNC_PULSE_WIDTH_UNIT	Default 0 for counting VSYNC_PULSE_WIDTH in terms of DISPLAY CLOCK (pix_clk) cycles. Set it to 1 to count in terms of complete horizontal lines.
19 HALF_LINE	Setting this bit to 1 will make the total VSYNC period equal to the VSYNC_PERIOD field plus half the HORIZONTAL_PERIOD field (i.e. VSYNC_PERIOD field plus half horizontal line), otherwise it is just VSYNC_PERIOD. Should be only used in the DOTCLK mode, not in the VSYNC interface mode.
18 HALF_LINE_MODE	When this bit is 0, the first field (VSYNC period) will end in half a horizontal line and the second field will begin with half a horizontal line. When this bit is 1, all fields will end with half a horizontal line, and none will begin with half a horizontal line.
VSYNC_PULSE_WIDTH	Number of units for which VSYNC signal is active. For the DOTCLK mode, the unit is determined by the VSYNC_PULSE_WIDTH_UNIT. If the VSYNC_PULSE_WIDTH_UNIT is 0 for DOTCLK mode, VSYNC_PULSE_WIDTH must be less than HSYNC_PERIOD. For the VSYNC interface mode, it should be in terms of number of DISPLAY CLOCK (pix_clk) cycles only.

35.6.9 eLCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIF_VDCTRL1)

This register is used to control the VSYNC signal in the VSYNC and DOTCLK modes of the block.

This register determines the period and duty cycle of the VSYNC signal when it is generated in the block.

Address: 21C_8000h base + 80h offset = 21C_8080h

LCDIF_VDCTRL1 field descriptions

Field	Description
VSYNC_PERIOD	Total number of units between two positive or two negative edges of the VSYNC signal. If HALF_LINE is set, it is implicitly calculated to be VSYNC_PERIOD plus half HSYNC_PERIOD.

35.6.10 LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIF_VDCTRL2)

This register is used to control the HSYNC signal in the DOTCLK mode of the block.

This register determines the period and duty cycle of the HSYNC signal when it is generated in the block.

Address: 21C_8000h base + 90h offset = 21C_8090h

LCDIF_VDCTRL2 field descriptions

Field	Description
31-18 HSYNC_PULSE_WIDTH	Number of DISPLAY CLOCK (pix_clk) cycles for which HSYNC signal is active.
HSYNC_PERIOD	Total number of DISPLAY CLOCK (pix_clk) cycles between two positive or two negative edges of the HSYNC signal.

35.6.11 eLCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIF_VDCTRL3)

This register is used to determine the vertical and horizontal wait counts.

This register determines the back porches of HSYNC and VSYNC signals when they are generated by the block.

Address: 21C_8000h base + A0h offset = 21C_80A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved			MUX_SYNC_SIGNALS	VSYNC_ONLY	HORIZONTAL_WAIT_CNT										
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	VERTICAL_WAIT_CNT															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_VDCTRL3 field descriptions

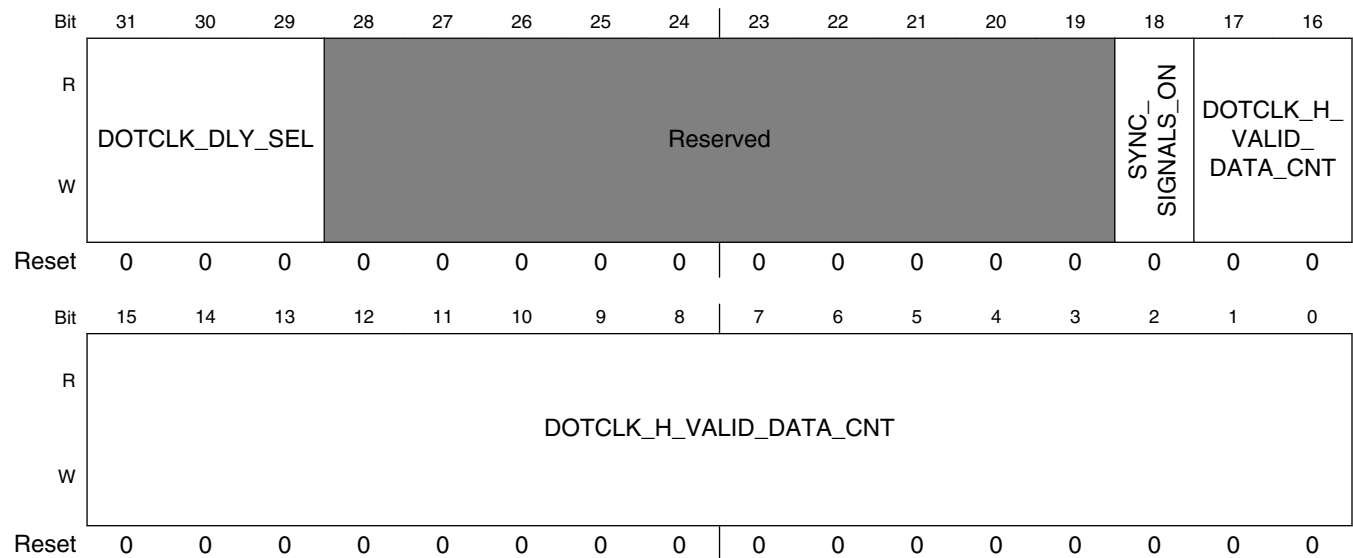

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29 MUX_SYNC_SIGNALS	When this bit is set, the eLCDIF block will internally mux HSYNC with LCD_D14, DOTCLK with LCD_D13 and ENABLE with LCD_D12, otherwise these signals will go out on separate pins. This feature can be used to maintain backward compatible with 37xx.
28 VSYNC_ONLY	This bit must be set to 1 in the VSYNC mode of operation, and 0 in the DOTCLK mode of operation.
27–16 HORIZONTAL_WAIT_CNT	In the DOTCLK mode, wait for this number of clocks from falling edge (or rising if HSYNC_POL is 1) of HSYNC signal to account for horizontal back porch plus the number of DOTCLKs before the moving picture information begins.
VERTICAL_WAIT_CNT	In the VSYNC interface mode, wait for this number of DISPLAY CLOCK (pix_clk) cycles from the falling VSYNC edge (or rising if VSYNC_POL is 1) before starting LCD transactions and is applicable only if WAIT_FOR_VSYNC_EDGE is set. Minimum is CMD_SETUP+5. In the DOTCLK mode, it accounts for the vertical back porch lines plus the number of horizontal lines before the moving picture begins. The unit for this parameter is inherently the same as the VSYNC_PERIOD_UNIT.

35.6.12 eLCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIF_VDCTRL4)

This register is used to control the DOTCLK mode of the block.

This register determines the active data in each horizontal line in the DOTCLK mode. Note that the total number of active horizontal lines in the DOTCLK mode is the same as the V_COUNT bitfield in the LCDIF_TRANSFER_COUNT register.

Address: 21C_8000h base + B0h offset = 21C_80B0h

LCDIF_VDCTRL4 field descriptions

Field	Description
31–29 DOTCLK_DLY_SEL	This bitfield selects the amount of time by which the DOTCLK signal should be delayed before coming out of the LCD_DOTCK pin. 0 = 2ns; 1=4ns;2=6ns;3=8ns. Remaining values are reserved.
28–19 RSRVD0	This field is reserved. Reserved bits, write as 0.
18 SYNC_SIGNALS_ON	Set this field to 1 if the LCD controller requires that the VSYNC or VSYNC/HSYNC/DOTCLK control signals should be active at least one frame before the data transfers actually start and remain active at least one frame after the data transfers end. The hardware does not count the number of frames automatically. Rather, the VSYNC edge interrupt can be monitored by software to count the number of frames that have occurred after this bit is set and then the RUN bit can be set to start the data transactions. This bit must always be set in the DOTCLK mode of operation, and it must be set in the VSYNC mode of operation when VSYNC signal is an output.
DOTCLK_H_VALID_DATA_CNT	Total number of DISPLAY CLOCK (pix_clk) cycles on each horizontal line that carry valid data in DOTCLK mode.

35.6.13 Digital Video Interface Control0 Register (LCDIF_DVICTRL0)

The Digital Video interface Control0 register provides the overall control of the Digital Video interface.

This register gives information about the horizontal active, horizontal blanking and total number of lines in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL0_H_ACTIVE_CNT_WR(0x5A0); //1440
HW_LCDIF_DVICTRL0_H_BLANKING_CNT_WR(0x106); //262
//625/50 video system
HW_LCDIF_DVICTRL0_H_ACTIVE_CNT_WR(0x5A0); //1440
HW_LCDIF_DVICTRL0_H_BLANKING_CNT_WR(0x112); //274
```

Address: 21C_8000h base + C0h offset = 21C_80C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_DVICTRL0 field descriptions

Field	Description
31–28 RSRVD1	This field is reserved. Reserved bits, write as 0.
27–16 H_ACTIVE_CNT	Number of active video samples to be transmitted. (Mostly will be 1440 for both PAL and NTSC). Must always be a multiple of 4.
15–12 RSRVD0	This field is reserved. Reserved bits, write as 0.
H_BLANKING_CNT	Number of blanking samples to be inserted between EAV and SAV during horizontal blanking interval.

35.6.14 Digital Video Interface Control1 Register (LCDIF_DVICTRL1)

The Digital Video interface Control1 register provides the overall control of the Digital Video interface.

This register contains information about the Field1 start and end, and the Field2 start in the ITU-R BT.656 interface.

EXAMPLE

ELCDIF Memory Map/Register Definition

```
//525/60 video system
HW_LCDIF_DVICTRL1_F1_START_LINE_WR(0x4); //4
HW_LCDIF_DVICTRL1_F1_END_LINE_WR(0x109); //265

LCDIF_DVICTRL1 field descriptions

Field	Description
31–30 RSRVDO	This field is reserved. Reserved bits, write as 0.
29–20 F1_START_LINE	Vertical line number from which Field 1 begins.
19–10 F1_END_LINE	Vertical line number at which Field1 ends.
F2_START_LINE	Vertical line number from which Field 2 begins.

35.6.15 Digital Video Interface Control2 Register (LCDIF_DVICTRL2)

The Digital Video interface Control2 register provides the overall control of the Digital Video interface.

This register contains information about the Field2 end, and the Vertical Blanking1 interval in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL2_F2_END_LINE_WR(0x3); //3
HW_LCDIF_DVICTRL2_V1_BLANK_START_LINE_WR(0x108); //264

LCDIF_DVICTRL2 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 F2_END_LINE	Vertical line number at which Field 2 ends.
19–10 V1_BLANK_START_LINE	Vertical line number towards the end of Field1 where first Vertical Blanking interval starts.
V1_BLANK_END_LINE	Vertical line number in the beginning part of Field2 where first Vertical Blanking interval ends.

35.6.16 Digital Video Interface Control3 Register (LCDIF_DVICTRL3)

The Digital Video interface Control3 register provides the overall control of the Digital Video interface.

This register contains information about the Vertical Blanking2 interval in the ITU-R BT. 656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL3_V2_BLANK_START_LINE_WR(0x1); //1
HW_LCDIF_DVICTRL3_V2_BLANK_END_LINE_WR(0x13); //19

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 V2_BLANK_START_LINE	Vertical line number towards the end of Field2 where second Vertical Blanking interval starts.
19–10 V2_BLANK_END_LINE	Vertical line number in the beginning part of Field1 where second Vertical Blanking interval ends.
V_LINES_CNT	Total number of vertical lines per frame (generally 525 or 625)

35.6.17 Digital Video Interface Control4 Register (LCDIF_DVICTRL4)

The Digital Video interface Control4 register provides the overall control of the Digital Video interface.

This register is used to add side borders to the output if the input frame width is less than 720 pixels.

EXAMPLE

```
//If input frame has only 640 pixels per line, but output is supposed to have
720 pixels per line.
HW_LCDIF_DVICTRL4_H_FILL_CNT_WR(0x50); //80
HW_LCDIF_DVICTRL4_Y_FILL_VALUE_WR(0x10); //16
HW_LCDIF_DVICTRL4_CB_FILL_VALUE_WR(0x80); //128
HW_LCDIF_DVICTRL4_CR_FILL_VALUE_WR(0x80); //128
```

Address: 21C_8000h base + 100h offset = 21C_8100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_DVICTRL4 field descriptions

Field	Description
31–24 Y_FILL_VALUE	Value of Y component of filler data

Table continues on the next page...

LCDIF_DVICTRL4 field descriptions (continued)

Field	Description
23–16 CB_FILL_VALUE	Value of CB component of filler data
15–8 CR_FILL_VALUE	Value of CR component of filler data.
H_FILL_CNT	Number of active video samples that have to be filled with the filler data in the front and back portions of the active horizontal interval. Must be a multiple of 4. This field will have to be programmed if the input frame has less than 720 pixels per line.

35.6.18 RGB to YCbCr 4:2:2 CSC Coefficient0 Register (LCDIF_CSC_COEFF0)

LCDIF_CSC_COEFF0 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0 * R + C1 * G + C2 * B + Y_offset$ $Cb = C3 * R + C4 * G + C5 * B + CbCr_offset$ $Cr = C6 * R + C7 * G + C8 * B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF0_C0_WR(0x41); //0.257x256=65
HW_LCDIF_CSC_COEFF0_CSC_SUBSAMPLE_FILTER_WR(0x3);
```

Address: 21C_8000h base + 110h offset = 21C_8110h

LCDIF_CSC_COEFF0 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C0	Two's complement red multiplier coefficient for Y
15–2 RSRVD0	This field is reserved. Reserved bits, write as 0.

Table continues on the next page...

LCDIF_CSC_COEFF0 field descriptions (continued)

Field	Description
CSC_SUBSAMPLE_FILTER	This register describes the filtering and subsampling scheme to be performed on the chroma components in order to convert from YCbCr 4:4:4 to YCbCr 4:2:2 space. Note that the following descriptions apply individually to Cb and Cr. 0x0 SAMPLE_AND_HOLD — No filtering, simply keep every chroma value for samples numbered 2n and discard chroma values associated with all samples numbered 2n+1. 0x1 RSRVD — Reserved 0x2 INTERSTITIAL — Chroma samples numbered 2n and 2n+1 are averaged (weights 1/2, 1/2) and that chroma value replaces the two chroma values at 2n and 2n+1. This chroma now exists horizontally halfway between the two luma samples. 0x3 COSITED — Chroma samples numbered 2n-1, 2n, and 2n+1 are averaged (weights 1/4, 1/2, 1/4) and that chroma value exists at the same site as the luma sample numbered 2n and the chroma samples at 2n+1 are discarded.

35.6.19 RGB to YCbCr 4:2:2 CSC Coefficient1 Register (LCDIF_CSC_COEFF1)

LCDIF_CSC_COEFF1 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0 * R + C1 * G + C2 * B + Y_offset$ $Cb = C3 * R + C4 * G + C5 * B + CbCr_offset$ $Cr = C6 * R + C7 * G + C8 * B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF1_C1_WR(0x81); //0.504x256=129
HW_LCDIF_CSC_COEFF1_C2_WR(0x19); //0.098x256=25
```

Address: 21C_8000h base + 120h offset = 21C_8120h

LCDIF_CSC_COEFF1 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C2	Two's complement blue multiplier coefficient for Y
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C1	Two's complement green multiplier coefficient for Y

35.6.20 RGB to YCbCr 4:2:2 CSC Coefficient2 Register (LCDIF_CSC_COEFF2)

LCDIF_CSC_COEFF2 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0*R + C1*G + C2*B + Y_offset$ $Cb = C3*R + C4*G + C5*B + CbCr_offset$ $Cr = C6*R + C7*G + C8*B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF2_C3_WR(0x3DB); //-0.148x256=-37
HW_LCDIF_CSC_COEFF2_C4_WR(0x3B6); //-0.291x256=-74
```

Address: 21C_8000h base + 130h offset = 21C_8130h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_CSC_COEFF2 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C4	Two's complement green multiplier coefficient for Cb
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C3	Two's complement red multiplier coefficient for Cb

35.6.21 RGB to YCbCr 4:2:2 CSC Coefficient3 Register (LCDIF_CSC_COEFF3)

LCDIF_CSC_COEFF3 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0*R + C1*G + C2*B + Y_offset$ $Cb = C3*R + C4*G + C5*B + CbCr_offset$ $Cr = C6*R + C7*G + C8*B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

ELCDIF Memory Map/Register Definition

```
HW_LCDIF_CSC_COEFF3_C5_WR(0x70) ;//0.439x256=112
HW_LCDIF_CSC_COEFF3_C6_WR(0x70) ;//0.439x256=112
```

Address: 21C_8000h base + 140h offset = 21C_8140h

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C6	Two's complement red multiplier coefficient for Cr
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C5	Two's complement blue multiplier coefficient for Cb

35.6.22 RGB to YCbCr 4:2:2 CSC Coefficient4 Register (LCDIF_CSC_COEFF4)

LCDIF_CSC_COEFF4 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0 * R + C1 * G + C2 * B + Y_offset$ $Cb = C3 * R + C4 * G + C5 * B + CbCr_offset$ $Cr = C6 * R + C7 * G + C8 * B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF4_C7_WR(0x3A2) ;//-0.368x256=-94
HW_LCDIF_CSC_COEFF4_C8_WR(0x3EE) ;//-0.071x256=-18
```

Address: 21C_8000h base + 150h offset = 21C_8150h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	

LCDIF_CSC_OFFSET field descriptions

Field	Description
31–25 RSRVD1	This field is reserved. Reserved bits, write as 0.
24–16 CBCR_OFFSET	Two's complement offset for the Cb and Cr components
15–9 RSRVD0	This field is reserved. Reserved bits, write as 0.
Y_OFFSET	Two's complement offset for the Y component

35.6.24 RGB to YCbCr 4:2:2 CSC Limit Register (LCDIF_CSC_LIMIT)

LCDIF_CSC_CTRL0 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0*R + C1*G + C2*B + Y_offset$ $Cb = C3*R + C4*G + C5*B + CbCr_offset$ $Cr = C6*R + C7*G + C8*B + CbCr_offset$

ELCDIF Memory Map/Register Definition

This register carries programming information about RGB to YCbCr 4:2:2 CSC. Note that the values in this register are unsigned.

EXAMPLE

```
HW_LCDIF_CSC_LIMIT_CBCR_MIN_WR(0x10); //16
HW_LCDIF_CSC_LIMIT_CBCR_MAX_WR(0xF0); //240
HW_LCDIF_CSC_LIMIT_Y_MIN_WR(0x10); //16
HW_LCDIF_CSC_LIMIT_Y_MAX_WR(0xEB); //235
```

Address: 21C_8000h base + 170h offset = 21C_8170h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_CSC_LIMIT field descriptions

Field	Description
31–24 CBCR_MIN	Lower limit of Cb and Cr after RGB to 4:2:2 YCbCr conversion
23–16 CBCR_MAX	Upper limit of Cb and Cr after RGB to 4:2:2 YCbCr conversion
15–8 Y_MIN	Lower limit of Y after RGB to 4:2:2 YCbCr conversion
Y_MAX	Upper limit of Y after RGB to 4:2:2 YCbCr conversion

35.6.25 LCD Interface Data Register (LCDIF_DATA)

This register is used to transfer data using the PIO interface mode of operation. In MPU mode, data written to this register will be transferred out to the display device. When receiving data from the display, data is read from this register using PIO operations. During write operations, data can be written to this register (from the processor's perspective) as bytes, half-words (16 bits), or words (32 bits) as desired.

This register holds the 32-bit word written by the ARM platform into LCDIF. This data then gets sent out by the block across the interface.

Address: 21C_8000h base + 180h offset = 21C_8180h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_DATA field descriptions

Field	Description
31–24 DATA_THREE	Byte 3 (most significant byte) of data written to LCDIF.
23–16 DATA_TWO	Byte 2 of data written to eLCDIF.
15–8 DATA_ONE	Byte 1 of data written to eLCDIF.
DATA_ZERO	Byte 0 (least significant byte) of data written to eLCDIF.

35.6.26 Bus Master Error Status Register (LCDIF_BM_ERROR_STAT)

This register reflects the virtual address at which the AXI master received an error response from the slave.

When the BM_ERROR_IRQ is asserted, the address of the bus error is updated in the register.

Address: 21C_8000h base + 190h offset = 21C_8190h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_BM_ERROR_STAT field descriptions

Field	Description
ADDR	Virtual address at which bus master error occurred.

35.6.27 CRC Status Register (LCDIF_CRC_STAT)

This register reflects the CRC value of each frame sent out by eLCDIF. The CRC is done on the final output bus, so the value will be dependent on the LCD_DATABUS_WIDTH bitfield even if the input data is the same.

This register will be updated when the CUR_FRAME_DONE_IRQ is asserted. In the case of DVI mode, the CRC is calculated for the entire frame, not separately for each field in the frame.

ELCDIF Memory Map/Register Definition

Address: 21C_8000h base + 1A0h offset = 21C_81A0h

LCDIF_CRC_STAT field descriptions

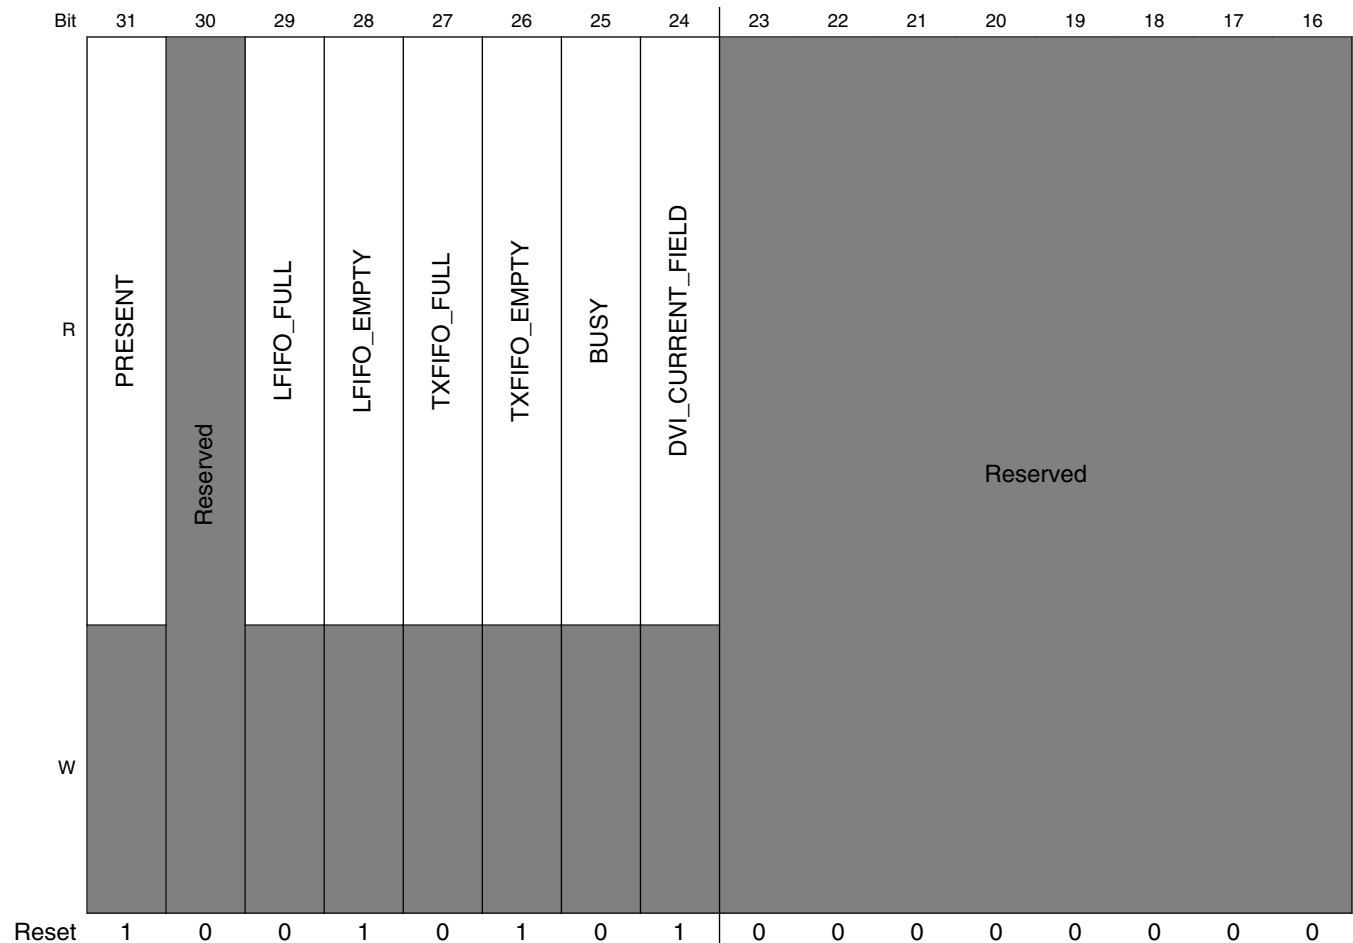

Field	Description
CRC_VALUE	Calculated CRC value.

35.6.28 LCD Interface Status Register (LCDIF_STAT)

The LCD interface status register can be used to check the current status of the eLCDIF block.

The LCD interface status register that contains read only views of some parameters or current state of the block.

Address: 21C_8000h base + 1B0h offset = 21C_81B0h

LCDIF_STAT field descriptions

Field	Description
31 PRESENT	0: eLCDIF not present on this product 1: eLCDIF is present.
30 -	This field is reserved. Reserved.
29 LFIFO_FULL	Read only view of the signal that indicates that LCD read datapath FIFO is full, will be generally used in the write mode of the LCD interface.
28 LFIFO_EMPTY	Read only view of the signal that indicates that LCD read datapath FIFO is empty, will be generally used in the read mode of the LCD interface.
27 TXFIFO_FULL	Read only view of the signal that indicates that LCD write datapath FIFO is full, will be generally used in the write mode of the LCD interface.
26 TXFIFO_EMPTY	Read only view of the signal that indicates that LCD write datapath FIFO is empty, will be generally used in the read mode of the LCD interface.
25 BUSY	Read only view of the input busy signal from the external LCD controller.
24 DVI_CURRENT_FIELD	Read only view of the current field being transmitted. DVI_CURRENT_FIELD = 0 means field 1. DVI_CURRENT_FIELD = 1 means field 2.
23–9 RSRVDO	This field is reserved. Reserved bits. Write as 0.
LFIFO_COUNT	Read only view of the current count in Latency buffer (LFIFO).

35.6.29 eLCDIF Threshold Register (LCDIF_THRES)

This register is used to activate control signals when the number of pixels reaches the programmed threshold. These control signals, in turn, can be used to manipulate access priority or dynamically change the input clock frequency to meet the required pixel throughput.

Memory request priority threshold register.

Address: 21C_8000h base + 200h offset = 21C_8200h

LCDIF_THRES field descriptions

Field	Description
31–25 RSRVD2	This field is reserved. Reserved bits. Write as 0.
24–16 FASTCLOCK	This value should be set to a value of pixels, from 0 to 511. When the number of pixels in the input pixel FIFO is LESS than this value, the fast clock control output will be raised. This signal can be used to reduce the system bus clock frequency to save power during horizontal or vertical blanking intervals. This value should also be programmed to a value that is greater than the "PANIC" threshold value. This will allow a faster clock to recover the number of pixels in the FIFO before a "panic" level is encountered.
15–9 RSRVD1	This field is reserved. Reserved bits. Write as 0.
PANIC	This value should be set to a value of pixels from 0 to 511. When the number of pixels in the input pixel FIFO is less than this value, the internal panic control output will be raised. This signal can be used to raise the access eLCDIF's access priority.

35.6.30 eLCDIF AS Buffer Control Register (LCDIF_AS_CTRL)

The Alpha Surface Parameter register provides additional controls for AS.

Address: 21C_8000h base + 210h offset = 21C_8210h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R						RVDS1

LCDIF_AS_CTRL field descriptions

Field	Description
31 CSI_VSYNC_ENABLE	When this bit is set by software, the LCDIF work as sync mode with CSI input.
30 CSI_VSYNC_POL	Default 0 active low during VSYNC_PULSE_WIDTH time and will be high during the rest of the VSYNC period. Set it to 1 to invert the polarity.

Table continues on the next page...

LCDIF_AS_CTRL field descriptions (continued)

Field	Description
29 CSI_VSYNC_MODE	this bit is set by software to decide which vsync generate mode. LCDIF vsync generate by internal counter when set to 0, LCDIF vsync delayed by each csi_vsync_in when set to 1; INT_SYNC_MODE = 0x0 LCDIF vsync generate by internal counter. EXT_SYNC_MODE = 0x1 LCDIF vsync delayed by each csi_vsync_in.
28 CSI_SYNC_ON_IRQ_EN	This bit is set to enable an interrupt when LCDIF lock with CSI vsync input.
27 CSI_SYNC_ON_IRQ	this bit is set by software to decide which vsync generate mode. LCDIF vsync generate by internal counter when set to 0, LCDIF vsync delayed by each csi_vsync_in when set to 1; INT_SYNC_MODE = 0x0 LCDIF vsync generate by internal counter. EXT_SYNC_MODE = 0x1 LCDIF vsync delayed by each csi_vsync_in.
26-24 RVDS1	Reserved, always set to zero.
23 PS_DISABLE	When this bit is set by software, the LCDIF will disable PS buffer data.
22-21 INPUT_DATA_SWIZZLE	This field specifies how to swap the bytes either in the HW_LCDIF_DATA register or those fetched by the AXI master part of LCDIF. The swizzle function is independent of the WORD_LENGTH bit. See the explanation of the HW_LCDIF_DATA below for names and definitions of data register fields. The supported swizzle configurations are: NO_SWAP = 0x0 No byte swapping.(Little endian) LITTLE_ENDIAN = 0x0 Little Endian byte ordering (same as NO_SWAP). BIG_ENDIAN_SWAP = 0x1 Big Endian swap (swap bytes 0, 3 and 1, 2). SWAP_ALL_BYTES = 0x1 Swizzle all bytes, swap bytes 0, 3 and 1, 2 (aka Big Endian). HWD_SWAP = 0x2 Swap half-words. HWD_BYTE_SWAP = 0x3 Swap bytes within each half-word.
20 ALPHA_INVERT	Setting this bit to logic 0 will not alter the alpha value. A logic 1 will invert the alpha value and apply (1-alpha) for image composition.
19-16 ROP	Indicates a raster operation to perform when enabled. Raster operations are enabled through the ALPHA_CTRL field. MASKAS = 0x0 AS AND PS MASKNOTAS = 0x1 nAS AND PS MASKASNOT = 0x2 AS AND nPS MERGEAS = 0x3 AS OR PS MERGENOTAS = 0x4 nAS OR PS MERGEASNOT = 0x5 AS OR nPS NOTCOPYAS = 0x6 nAS NOT = 0x7 nPS NOTMASKAS = 0x8 AS NAND PS NOTMERGEAS = 0x9 AS NOR PS XORAS = 0xA AS XOR PS NOTXORAS = 0xB AS XNOR PS

Table continues on the next page...

LCDIF_AS_CTRL field descriptions (continued)

Field	Description
15–8 ALPHA	Alpha modifier used when the ALPHA_MULTIPLY or ALPHA_OVERRIDE values are programmed in REG_AS_CTRL[ALPHA_CTRL]. The output alpha value will either be replaced (ALPHA_OVERRIDE) or scaled (ALPHA_MULTIPLY) when selected.
7–4 FORMAT	Indicates the input buffer format for AS. ARGB8888 = 0x0 32-bit pixels with alpha RGB888 = 0x4 32-bit pixels without alpha (unpacked 24-bit format) ARGB1555 = 0x8 16-bit pixels with alpha ARGB4444 = 0x9 16-bit pixels with alpha RGB555 = 0xC 16-bit pixels without alpha RGB444 = 0xD 16-bit pixels without alpha RGB565 = 0xE 16-bit pixels without alpha
3 ENABLE_ COLORKEY	Indicates that colorkey functionality is enabled for this alpha surface. Pixels found in the alpha surface colorkey range will be displayed as transparent (the PS pixel will be used).
2–1 ALPHA_CTRL	Determines how the alpha value is constructed for this alpha surface. Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. Embedded = 0x0 Indicates that the AS pixel alpha value will be used to blend the AS with PS. The ALPHA field is ignored. Override = 0x1 Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. Multiply = 0x2 Indicates that the value in the ALPHA field should be used to scale all pixel alpha values. Each pixel alpha is multiplied by the value in the ALPHA field. ROPs = 0x3 Enable ROPs. The ROP field indicates an operation to be performed on the alpha surface and PS pixels.
0 AS_ENABLE	When this bit is set by software, the LCDIF will start fetching AS buffer data in bus master mode and combine it with another buffer.

35.6.31 Alpha Surface Buffer Pointer (LCDIF_AS_BUF)

This register is used to indicate the base address of the AS buffer.

Address: 21C_8000h base + 220h offset = 21C_8220h

LCDIF_AS_BUF field descriptions

Field	Description
ADDR	Address pointer for the alpha surface 0 buffer.

35.6.32 LCDIF_AS_NEXT_BUF

When the LCDIF is behaving as a master, this address points to the address of the next frame of data that will be sent out via the LCDIF. It is upto the software to make sure that this register is programmed before the end of the current frame, otherwise it might result in old data going out the LCDIF. This address must always be double-word aligned.

Address: 21C_8000h base + 230h offset = 21C_8230h

LCDIF_AS_NEXT_BUF field descriptions

Field	Description
ADDR	Address of the next frame that will be transmitted by eLCDIF.

35.6.33 eLCDIF Overlay Color Key Low (LCDIF_AS_CLRKEYLOW)

If a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. Colorkey operations are higher priority than alpha or ROP operations.

Address: 21C_8000h base + 240h offset = 21C_8240h

LCDIF_AS_CLRKEYLOW field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of RGB color key applied to AS buffer

35.6.34 eLCDIF Overlay Color Key High (LCDIF_AS_CLRKEYHIGH)

If a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. Colorkey operations are higher priority than alpha or ROP operations.

Address: 21C_8000h base + 250h offset = 21C_8250h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

H_COUNT_DELAY	LCDIF VSYNC delayed counter for CSI_VSYNC.

Chapter 36

Multi Mode DDR Controller (MMDC)

36.1 Overview

MMDC is a multi-mode DDR controller that supports DDR3/DDR3L x16 and LPDDR2 x16 memory types. MMDC is configurable, high performance, and optimized.

The following figure shows the MMDC block diagram.

Figure 36-1. MMDC block diagram

MMDC consists of a core (MMDC_CORE) and PHY (MMDC_PHY).

- The core is responsible for communication with the system through an AXI interface, DDR command generation, DDR command optimizations, and a read/write data path.
- The PHY is responsible for the timing adjustment; it uses special calibration mechanisms to ensure data capture margin at a clock rate of up to 400 MHz.

The internal memory map (configuration registers) of the MMDC can be configured through an IP channel (IP0).

36.1.1 MMDC feature summary

The table found here summarizes the MMDC features.

Table 36-1. MMDC feature summary

Feature	Details
DDR standards	<ul style="list-style-type: none"> • DDR3L, DDR3 x16 • LPDDR2 x16 • Does not support LPDDR1MDDR or DDR2
DDR interface	<ul style="list-style-type: none"> • x16 data bus width • Density per DDR device of 256 Mbits–8 Gbits with the following column and row combinations: <ul style="list-style-type: none"> • Column size of 8–12 bits • Row size of 11–16 bits • Two chip selects (one chip select for DDR3/DDR3L, two chip selects for LPDDR2) • Up to 4 Gbytes of address space with configurable partitioning between CS0 and CS1 (for LPDDR2 2ch x32 up to 2 Gbytes per channel) • Supports burst length of 8 (aligned) for DDR3 • Supports burst length of 4 for LPDDR2
DDR performance	<ul style="list-style-type: none"> • MMDC running at up to 400 MHz (800 MT/s), see CCM block for actual clock frequencies supported. • Supports Real-Time priority by means of QoS sideband priority signals from the chip to enable various priority levels in the re-ordering mechanism: real-time, latency sensitive, normal priority. • Page hit/page miss optimizations • Consecutive read/write access optimizations • Supports deep read and write request queues to enable bank prediction. • Drives back the critical word in a read transaction as soon as it is received by the DDR device (does not wait until the whole data phase has been completed). • Keeps tracking of open memory pages • Supports bank interleaving • Special optimization in case of non-aligned wrap accesses in DDR3 mode (burst length 8) <p>NOTE: Due to reordering and optimization mechanisms (per different AXI Identifier (ID)), the transactions towards the DDR device may be driven in a different ID order than was received by the AXI master. In a similar fashion, the write response, read response or read data may be driven to the AXI master in a different ID order.</p>
AXI interface	<ul style="list-style-type: none"> • AXI bus compliant • Supports bus transfers of 8, 16, 64 bits (single accesses and bursts) running at 400 MHz.

Table continues on the next page...

Table 36-1. MMDC feature summary (continued)

Feature	Details
	<ul style="list-style-type: none"> • Supports AXI bursts length of up to 16 • Supports burst types of WRAP, INCR and FIXED • Supports 16 bits AXI ID • Write data interleave depth is 1 (no support for Write Data Interleave) • Supports write data before address • Supports buffered/non-buffered accesses (AWCACHE[0] = 0b means a non-bufferable access and AWCACHE[0] = 1b means a bufferable access). The rest of the CACHE options are not supported <ul style="list-style-type: none"> • To keep data access coherency between write and read access of the same master, the response signal is sent as follows: <ul style="list-style-type: none"> • Bufferable write access—BRESP will be sent when last data of the access has entered the MMDC. • Non-bufferable write access—BRESP will be sent when the data was physically written into the external memory device. • Supports four exclusive monitors per configurable ID for only a single access with a size of up to 64 bits • Supports AXI responses as follows: <ul style="list-style-type: none"> • Okay in case the access has been successful or exclusive access failure • Slave error in case of security violation • Exclusive okay in case the read or the write portion of an exclusive access has been successful
DDR calibration and delay-lines.	<ul style="list-style-type: none"> • Supports various calibration processes which can be performed either automatically (hardware) or manually (software) towards either CS0 or CS1. (At the end of the process the delay-lines will work with one set of results.) The following calibration processes are supported: <ul style="list-style-type: none"> • ZQ calibration for external DDR device (in DDR3 through ZQ calibration command and in LPDDR2 through MRW command) <ul style="list-style-type: none"> • Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh) • Can be handled manually at ZQ INIT • ZQ calibration for DDR I/O pads for calibrating the DDR driving strength <ul style="list-style-type: none"> • The sequence can be handled automatically by hardware • The sequence can be handled step by step manually by software • Read data calibration. Adjustment of read DQS with read data byte. • Read DQS gating calibration for DDR3 only. Adjustment of DQS gate with read preamble window. • Write data calibration. Adjustment of write DQS with write data byte. • Write leveling calibration. Adjustment of write DQS with CK (DDR differential clock). • Read fine tuning. Adjustment of up to 7 delay-line units for each read data bit. • Write fine tuning. Adjustment of up to 3 delay-line units for each read data bit. • Periodic delay-line measurement for keeping its accuracy during refresh interval. • Additional fine tuning delay lines to adjust DDR clock delay, DDR clock duty cycle, DQS duty cycle.
Power saving	<ul style="list-style-type: none"> • Support of dynamic voltage, frequency change and self-refresh mode entry through hardware and software negotiation with the system (request/acknowledge handshake) <ul style="list-style-type: none"> • Upon hardware or software self-refresh request assertion, further AXI requests are blocked (even before the assertion of the acknowledge). • During self-refresh mode the system may deassert the operating clock of the MMDC for power saving. • During self-refresh mode the clock (CK) that is driven to the DDR device will be gated for power saving. • Supports automatic self-refresh and power down entry and exit <ul style="list-style-type: none"> • In automatic self-refresh, the internal operating clock will be gated for power saving.

Table continues on the next page...

Table 36-1. MMDC feature summary (continued)

Feature	Details
	<ul style="list-style-type: none"> • Supports fast and slow precharge power down in DDR3 • Automatic active and precharge power down timer per chip select (one chip select can enter power down while the other is still working) • While CS (chip-select) is inactive (high) the command and address buses are not toggling for power saving.
DDR general	<ul style="list-style-type: none"> • Configurable timing parameters • Configurable refresh scheme • Page boundary crossing support <ul style="list-style-type: none"> • Automatically generates precharge command and activates the next row • Supports various ODT control schemes <ul style="list-style-type: none"> • Assertion or deassertion of ODT control per read or write accesses and for active or passive CS (chip-select) • Supports MRW and MRR commands for LPDDR2 • Software control in LPDDR2 mode for switching to derated timing parameters and/or update the refresh rate according to temperature sensor • Debug and profiling capabilities

36.2 External Signals

The table found here describes the external signals of MMDC.

Table 36-2. MMDC External Signals

Signal	Description	Pad	Mode	Direction
DRAM_ADDR[15:0]	Address Bus Signals	DRAM_A[15:0]	No Muxing	O
DRAM_CAS	Column Address Strobe Signal	DRAM_CAS	No Muxing	O
DRAM_CS[1:0]	Chip Selects	DRAM_CS[1:0]	No Muxing	O
DRAM_DATA[31:0]	Data Bus Signals	DRAM_D[31:0]	No Muxing	I/O
DRAM_DQM[1:0]	Data Mask Signals	DRAM_DQM[1:0]	No Muxing	O
DRAM_ODT[1:0]	On-Die Termination Signals	DRAM_SDOdT[1:0]	No Muxing	O
DRAM_RAS	Row Address Strobe Signal	DRAM_RAS	No Muxing	O
DRAM_RESET	Reset Signal	DRAM_RESET	No Muxing	O
DRAM_SDBA[2:0]	Bank Select Signals	DRAM_SDBA[2:0]	No Muxing	O
DRAM_SDCKE[1:0]	Clock Enable Signals	DRAM_SDCKE[1:0]	No Muxing	O
DRAM_SDCLK0_N	Negative Clock Signals	DRAM_SDCLK_[1:0]	No Muxing	O
DRAM_SDCLK0_P	Positive Clock Signals	DRAM_SDCLK_[1:0]	No Muxing	O
DRAM_SDQS[1:0]_N	Negative DQS Signals	DRAM_SDQS[1:0]_N	No Muxing	I/O
DRAM_SDQS[1:0]_P	Positive DQS Signals	DRAM_SDQS[1:0]_P	No Muxing	I/O
DRAM_SDWE	WE signal	DRAM_SDWE	No Muxing	O
DRAM_ZQPAD	ZQ signal	DRAM_ZQPAD	No Muxing	O

36.3 Clocks

The table found here describes the clock sources for MMDC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

NOTE

The terms *clocks* and *cycles* are used interchangeably and refer to the clock period of the main ddr clock (mmdc_axi_clk_root), commonly referred to as the DDR frequency.

Table 36-3. MMDC Clocks

Clock name	Clock Root	Description
aclk_fast_core_p0	mmdc_axi_clk_root	Fast clock (channel 1)
ipg_clk_p0	ipg_clk_root	Peripheral clock (channel 1)
aclk_fast_phy_p0	mmdc_axi_clk_root	Fast clock (channel 1 - PHY)

36.4 Functional Description

This section provides a complete functional description of the block.

36.4.1 Write/Read data flow

36.4.1.1 Write data flow

- Write requests are received into an 8 entries request FIFO. Access is received only when there are at least two available entries. Each entry holds all of the AXI attributes.
 - If the burst length is greater than 8, the access splits into two accesses: one with burst length 8 and the other with the remainder.
 - The access can be performed as soon as the entire data phase of the associated write request is completed (all data beats were received).
- A simple round-robin arbitration between the pending read and write accesses is performed, and the pointer to this stage's winner access is sent to the re-ordering buffer.

3. The reordering mechanism is activated to find the winner access, which is the access that best utilizes the DDR bus, based on its dynamic score. For further information see [Dynamic scoring mode \(Arbitration Winning Conditions\)](#).
4. The winner write access at the previous stage is received and is held for dispatch to the DDR logic.
5. When the DDR command control unit is ready to accept the write request, it issues (if needed) a precharge/active command to the DDR device according to the status of the bank model and the parameters of the timers.
6. The DDR logic drives the associated data to the DDR device through the DDR PHY.

36.4.1.2 Read data flow

1. Read requests are received into a 16 entry request FIFO in MMDC if there are at least two available entries. Each entry holds all of the AXI attributes.

NOTE

If the burst length is greater than 8, the access splits into 2 accesses (one with burst length 8 and the other with the remainder).

2. A simple round-robin arbitration between the pending read and write accesses is performed and the pointer to this phase's winner access is sent to the re-ordering buffer.
3. The reordering mechanism is activated to find the winner access, which is the access that best utilizes the DDR bus, based on its dynamic score. For further information see [Dynamic scoring mode \(Arbitration Winning Conditions\)](#).
4. The winner read access at the previous stage is sampled and is held for dispatch to the DDR logic. This read access will be dispatched when there is at least one free slot in the read data buffer to store the data.
5. When the DDR command control unit is ready to accept the read request, it issues (if needed) a precharge/active command to the DDR device according to the status of the bank model and the parameters of the timers.
6. The MMDC PHY samples the read data, and the DDR logic transfers the data to the associated slot in the read data buffer.
7. MMDC transfers the data back to the master.

36.4.2 MMDC initialization

Because the MMDC is disabled when the chip exits reset, no clock is driven to the DDR device and the whole interface towards the DDR device is inactive. The following steps are required to activate the MMDC properly.

NOTE

To guarantee that the DRAM_RESET and DRAM_SDCKE signals are kept low during the power-up and reset sequences of the chip (as defined by JEDEC), you must connect those signals to pull-down resistors.

1. Set MDSCR[CON_REQ], which sets the configuration request; note that because the MMDC is disabled, there is no need to poll the configuration acknowledge bit at MDSCR[CON_ACK].
2. Configure the desired timing parameters at the MDCFG0, MDCFG1, MDCFG2, and MDOTC registers.
3. Configure the DDR type and other miscellaneous parameters at the MDMISC register.
4. Configure the required delay while leaving reset, at the MDOR register.
5. Configure the DDR physical parameters (density and burst length) at the MDCTL register.
6. Perform a ZQ calibration of the MMDC module to correctly initialize drive strengths.
7. Enable MMDC with the desired chip select at MDCTL[SDE_0] (for chip select 0) and MDCTL[SDE_1] (for chip select 1). At this point, MMDC starts the reset and initialization sequence related to DRAM_RESET/DRAM_SDCKE as defined by JEDEC.
8. Complete the initialization sequence as defined by JEDEC by issuing MRS/MRW commands for (ZQ, ODT, PRE, and so on). To issue those commands, configure the appropriate command and address at the MDSCR register.
9. Program the DDR mode registers by configuring the appropriate command and address at the MDSCR register.
10. Configure the power down and self-refresh entry and exit parameters at the MDPDC and MAPSR registers.
11. Configure the ZQ scheme at the MPZQHWCTRL and MPZQLP2CTRL registers.
12. Configure and activate the periodic refresh scheme at the MDREF register.
13. Deassert the configuration request by clearing MDSCR[CON_REQ].

NOTE

Steps 1 through 5 are non-blocking and can be done in any order.

Upon completion of these steps, MMDC is ready for work and to process AXI accesses.

NOTE

To achieve better timing and better precision, it is recommended that users configure the MMDC PHY delay parameters by operating either the automatic or manual

calibration process. Before starting any calibration process, you must disable the periodic refresh scheme (MDREF[REF_SEL] = 11) and then issue a manual refresh command by configuring MDSCR[CMD] to 2h. For further information, see [Calibration Process](#).

36.4.3 Configuring the MMDC registers

To safely modify MMDC's internal configuration registers, MMDC must be placed into configuration mode.

Use the following steps to enter configuration mode.

1. Issue a configuration request by setting MDSCR[CON_REQ].
2. Poll on configuration acknowledge until it is set at MDSCR[CON_ACK].

At this point, MMDC enters configuration mode and accessing the MMDC registers is permitted.

NOTE

During configuration mode, MMDC prevents further AXI accesses from being acknowledged.

Upon deassertion of MDSCR[CON_REQ], MMDC leaves configuration mode and AXI accesses are processed.

36.4.4 MMDC Address Space

36.4.4.1 Address decoding

MMDC supports up to two consecutive chip selects, each with the same density.

It is optional to configure the partition between the chip selects through MDASP[CS0_END].

The incoming AXI address bus is 32 bits. MMDC decodes each access as follows:

1. chip select
2. bank number
3. row number
4. column number

The following registers in the MMDC define the DDR address space:

- MDMISC[DDR_4_BANK]—Defines either 4 or 8 banks in the DDR device
- MDCTL[DSIZ]—Defines the DDR data bus width of x16
- MDMISC[BI]—Defines whether bank interleaving is on or off
- MDCTL[COL]—Defines the column size of the DDR device
- MDCTL[ROW]—Defines the row size of the DDR device

The following tables show address decoding examples for x16 bit DDR devices when bank interleaving is both on and off. It is assumed that the configuration is as follows: 8 banks (3 bits), 15 bit assignment for the row, and 10 bit assignment for the column. The total density is 256 MWords (512 Mbytes for x16).

NOTE

Chip selection is done by comparing the 7 most significant address bits (ARADDR[31:25]/AWADDR[31:25]) with MDASP[CS0_END].

Table 36-4. Address decoding—bank interleaving off

NOTE

In cases where this is an access to a non-initialized or disconnected chip select, behavior may be unexpected.

36.4.4.2 Chip select settings

MMDC drives the incoming access to either CS0 or CS1 by comparing the 7 most significant address bits (ARADDR[31:25]/AWADDR[31:25]) with MDASP[CS0_END].

Generally, the total density per chip-select must be the same, and the total density per chip-select must be a power of two.

[Creating 4 Gbyte address space with 2 Gbyte CS density](#) and [Creating 2 Gbyte address spaces with 1 Gbyte CS density](#) show how to create a continuous address space and configure the MMDC accordingly.

36.4.4.2.1 Creating 4 Gbyte address space with 2 Gbyte CS density

If the DDR memory space allocation is 4 Gbytes, only one configuration of chip select partition is allowed. The register MDASP[CS0_END] should be set to 2 Gbytes partition (16Gb).

The figure below shows the associated memory space.

Figure 36-2. Chip select partition—2 Gbytes per chip select

36.4.4.2.2 Creating 2 Gbyte address spaces with 1 Gbyte CS density

If the DDR memory space allocation is 2 Gbytes, there are three options for configuring the chip select partition: MDASP[CS0_END] to 001_1111 (1 Gbyte), MDASP[CS0_END] to 011_1111 (2 Gbytes), and MDASP[CS0_END] to 101_1111 (3 Gbytes).

If DDR memory space allocation is 2 Gbytes, there are three options for configuring the chip select partition:

- MDASP[CS0_END] to 001_1111 (1 Gbyte)
- MDASP[CS0_END] to 011_1111 (2 Gbytes)
- MDASP[CS0_END] to 101_1111 (3 Gbytes)

The figure below shows the associated memory space:

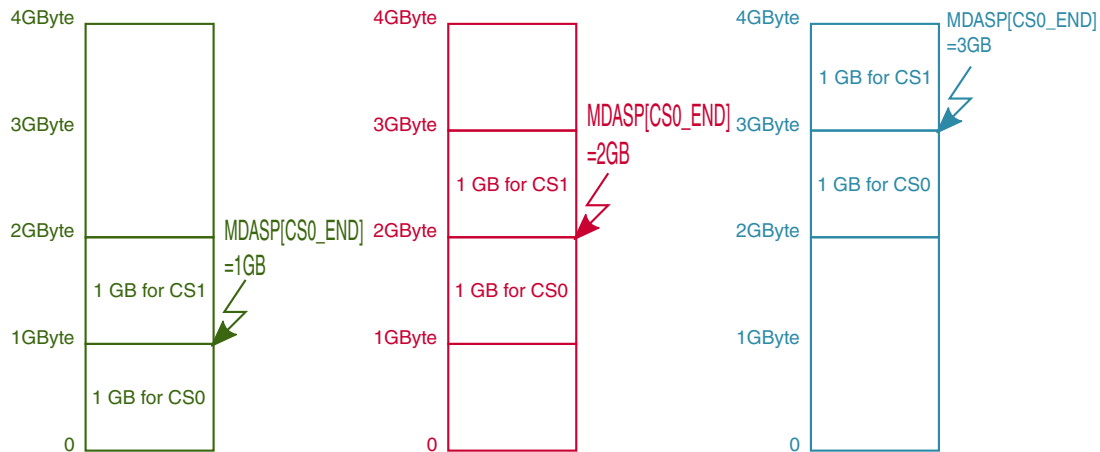

Figure 36-3. Chip select partition—1 Gbyte per chip select

36.4.4.3 Translation of AXI accesses to DDR accesses

36.4.4.3.1 Example 1

Assume the AXI read access has the following attributes:

- Wrap (arburst[1:0] = 10b)
- AXI size of 128 bits (arsize[2:0] = 100b)
- AXI length of 8 (arlen[3:0] = 0111b)
- AXI address with suffix B0h (non-aligned to AXI wrap boundary which is 16Bx8 = 128B = 0x80)

Toward DDR3(MDMISC[DDR_TYPE] = 00b) with the following attributes:

- x32 (MDCTL[DSIZ] = 01b)
- burst length of 8 (MDCTL[BL] = 1b)

In this case, the AXI wrap boundary is every 16Bx8=128B (0x80) and the DDR wrap boundary is every 4Bx8=32B(0x20).

The master expects to fetch the data that is associated with the following addresses: 0xB0, 0xC0, 0xD0, 0xE0, 0xF0, 0x80, 0x90, 0xA0.

The first aligned AXI address that is associated with suffix 0xB0 is with suffix 0x80, and the last wrap AXI address is with suffix 0xFF. Because the AXI master expects to get the first data from AXI address with suffix 0xB0, the MMDC issues the following accesses toward the DDR:

- Read access toward logic address with suffix 0xA0 (DDR boundary is 0x20 and 0xA0 is the closest to 0xB0)

NOTE

Logic address is the address of the column normalized to 1 byte.

- Read access toward logic address with suffix 0xC0
- Read access toward logic address with suffix 0xE0
- Read access toward logic address with suffix 0x80

The MMDC breaks the AXI access into four DDR accesses and returns the read data associated with address 0xB0 to the master first. The read data fetched from address 0xA0 is stored in the internal buffers and is driven back to the master at the end.

36.4.4.3.2 Example 2

Assume the AXI write access has the following attributes:

- Increment (awburst[1:0]=2'b01)
- AXI size of 64bits (awsize[2:0]=3'b011)
- AXI length of 8 (awlen[3:0]=4'b0111)
- AXI address with suffix 0xB0 (aligned as the size of the increment is 8B)

Toward DDR3(MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x64 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case, the AXI alignment is every 8B and the DDR boundary is every 8Bx8=64B(0x40).

The master expects to write the data to the following addresses: 0xB0, 0xB8, 0xC0, 0xC8, 0xD0, 0xD8, 0xE0, 0xE8.

The MMDC will issue the following accesses toward the DDR:

Functional Description

- Write access toward logic address with suffix 0x80 (DDR boundary is 0x40 and 0x80 is the closest to 0xB0) while address 0x80 to 0xAF are masked by DM (data masking signal).

NOTE

Logic address is the address of the column normalized to 1 byte.

- Write access toward logic address with suffix 0xC0 while addresses 0xF0 through 0xFF are masked by DM (data masking signal)

The MMDC will break the AXI access into two DDR accesses.

36.4.4.3.3 Example 3

Assume the AXI write access has the following attributes:

- Wrap (awburst[1:0]=2'b10)
- AXI size of 128bits (awsize[2:0]=3'b100)
- AXI length of 4 (awlen[3:0]=4'b0011)
- AXI address with suffix 0x80 (aligned)

Toward DDR3(MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x64 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case, the AXI wrap boundary is every $16B \times 4 = 64B$ (0x40) and the DDR wrap boundary is every $8 \times 8 = 64B$ (0x40).

The master expects to write the data to the following addresses: 0x80, 0x90, 0xA0, 0xB0.

Because the AXI wrap boundary and DDR wrap boundary are similar and the starting AXI address is aligned, the MMDC will issue only one access toward the DDR as follows:

- Write access towards logic address with suffix 0x80

NOTE

Logic address is the address of the column normalized to 1 byte.

36.4.4.3.4 Example 4

Assume the AXI write access has the following attributes:

- Increment (awburst[1:0]=2'b01)

- AXI size of 64bits (awsize[2:0]=3'b011)
- AXI length of 2 (awlen[3:0]=4'b0001)
- AXI address with suffix 0x5 (non aligned)

Toward DDR3(MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x32 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case the AXI alignment is every 8B (0x8) and the DDR boundary is every 4Bx8=32B(0x20).

The master expects to write the data to the following addresses: 0x5 (with WSTRB=0xE0), 0x8 (till 0xF).

The MMDC will issue one access toward the DDR as follows:

Write access toward logic address with suffix 0x0 (DDR boundary is 0x20 and 0x0 is the closest to 0x0) while address 0x0 till 0x4 are masked by DM (data masking signal) and address 0x10 till 0x1F are also masked by DM.

36.4.4.3.5 Example 5

Assume AXI write access has the following attributes:

- Increment (awburst[1:0]=2'b01)
- AXI size of 64bits (awsize[2:0]=3'b011)
- AXI length of 7 (awlen[3:0]=4'b0001)
- AXI address with suffix 0x10 (aligned)

Toward DDR3 (MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x64 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case the AXI alignment is every 8B (0x8) and the DDR boundary is every 8Bx8=64B(0x40).

The master expects to write the data to the following addresses: 0x10, 0x18, 0x20, 0x28, 0x30, 0x38, 0x40, 0x48.

Because the AXI access is not aligned to DDR boundary, which is every 0x40, the MMDC will issue two accesses toward the DDR as follows:

- Write access toward logic address with suffix 0x0 while address 0x0 till 0xF are masked by DM (data masking signal).

NOTE

Logic address is the address of the column normalized to 1 byte.

- Write access towards logic address with suffix 0x40 while addresses 0x50 till 0x7F are masked by DM (data masking signal).

36.4.4.4 Address mirroring

When enabling this feature, address bits DRAM_A3, DRAM_A4, DRAM_A5, DRAM_A6, DRAM_A7, DRAM_A8, DRAM_SDBA0, and DRAM_SDBA1 behave differently according to the associated chip select.

This feature facilitates PCB board routing for devices on chip select 1, which are typically populated on the opposite side of the PCB from the devices on chip select 0.

NOTE

This feature is only supported for DDR3 memories. It is not supported for LPDDR2 memories.

NOTE

This feature will not be supported for DDR3 since only a single chip select is supported for DDR3

The following table specifies the address mirroring options:

Table 36-6. Address mirroring options

MMDC pin	Chip select 0 pin	Chip select 1 pin
DRAM_A3	DRAM_A3	DRAM_A4
DRAM_A4	DRAM_A4	DRAM_A3
DRAM_A5	DRAM_A5	DRAM_A6
DRAM_A6	DRAM_A6	DRAM_A5
DRAM_A7	DRAM_A7	DRAM_A8
DRAM_A8	DRAM_A8	DRAM_A7
DRAM_SDBA0	DRAM_SDBA0	DRAM_SDBA1
DRAM_SDBA1	DRAM_SDBA1	DRAM_SDBA0

36.4.5 LPDDR2 and DDR3 pin mux mapping

The following table shows the pin mux mapping between LPDDR2 and DDR3. The i.MX DDR I/O pads corresponds with the DDR3 standard.

- In DDR3, all DRAM_DATA, DRAM_SDQS, and DRAM_DQM data lines work with channel 0.
- In LPDDR2, DRAM_DDQS[3:0], DRAM_DATA[31:0] and DRAM_DQM[3:0] work with channel 0. DRAM_SDQS[7:4], DRAM_DATA[63:32], and DRAM_DQM[7:4] work with channel 1.

Table 36-7. LPDDR2 and DRAM pin mux mapping

DRAM I/O pad	LPDDR2 I/O pad
DRAM_ADDR00	LPDDR2_CA0
DRAM_ADDR01	LPDDR2_CA1

36.4.6 Power Saving and Clock Frequency Change modes

36.4.6.1 Power saving general

MMDC supports multiple DDR power saving modes.

NOTE

At default, the power saving modes are disabled. These modes may dramatically decrease the power consumption of DDR memories.

1. Self-refresh entry to the entire DDR device (for both chip select 0 and 1) can be activated through two mechanisms:
 - LPMD (Low Power Mode)
 - Hardware handshaking (LPMD/LPACK) with the clock module in the system
 - Software handshaking by setting the field MAPSR[LPMD] and polling MAPSR[LPACK]
 - Automatic entry by configuring the amount of idle cycle for triggering self-refresh entry through MAPSR[PST] and by clearing MAPSR[PSD]
 - DVFS (Dynamic Voltage and Frequency Change)
 - Hardware handshaking (DVFS/DVACK) with the clock module in the system
 - Software handshaking by setting the field MAPSR[DVFS] and polling MAPSR[DVACK]

NOTE

If hardware or software requests for self-refresh entry were detected by the MMDC (even before the assertion of the LPACK), no write or read accesses will be acknowledged until the deassertion of those requests.

2. Automatic active/precharge power down entry to a specific chip select can be activated by configuring the ESDPDC register:
 - PWDT_0/PWDT_1 - define the number of idle cycles before entering power down, can be different value per chip select.
 - SLOW_PD - In case of DDR3 memory is configured to use slow precharge power down then this bit should be set as well.
 - BOTH_CS_PS - The MMDC can either set each chip select independently to power down, according to its idle state, or set both chip selects to power down only if both in idle state for the configured period.
 - Few parameters must be configured in addition:

- Timing parameters at MDCFG0[tXP and tXPDLL].
- ODT timing at MDOTC[tAOFPD, tAONPD, tANPD and tAXPD]

NOTE

It is possible to enter certain chip selects to low power consumption while the second chip select is activated.

3. Automatic precharge of all DDR banks to a specific chip select. Can be activated by configuring ESDPDC fields: PRCT_0 and PRCT_1. Each field determines a value loaded to a different chip select.

36.4.6.2 Self refresh and Frequency change entry/exit

As described in [Power saving general](#), the MMDC supports two mechanisms that will cause the DDR device to enter self-refresh mode:

- LPMD (Low Power Mode) - For power saving purposes
- DVFS (Dynamic Voltage and Frequency Change) - For clock frequency changes

While the DDR device is in self-refresh mode, there is no need to provide periodic refresh commands.

The MMDC treats hardware/software handshaking of LPMD/DVFS in the same manner:

- Upon the assertion of LPMD/DVFS request, the following is done:
 - The MMDC blocks any further AXI accesses even before the acknowledge is asserted
 - Completes all opened AXI accesses
 - Closes (precharge) all banks in the appropriate timing
 - Drives self-refresh command by deasserting clock enable signal (DRAM_SDCKE is driven to "0") together with a refresh command. This occurs after satisfying tRP/tRPA from the precharge all command.
 - Deasserts the clock (CK) that is driven to the DDR device
 - Asserts LPMD/DVFS acknowledge (LPACK/DVACK)
 - Allows deassertion of the operating clock of the MMDC (AXI clock)
- Upon the deassertion of LPMD/DVFS request, the following is done:
 - Operating clock of the MMDC must be turned on before LPMD/DVFS is deasserted
 - Starts driving the clock (CK) to the DDR device
 - After satisfying tCKSRX from clock renewal the clock enable signal (DRAM_SDCKE) is asserted
 - LPMD/DVFS acknowledge (LPACK/DVACK) is deasserted

Functional Description

- After satisfying t_{XS} from the assertion of `DRAM_SDCKE`, a refresh command is driven to the DDR device.
- If ZQ calibration is enabled then t_{RFC} is satisfied from the refresh command and a long ZQ command is driven.
- t_{ZQoper} idle cycles are counted after the ZQ command.
- After satisfying t_{DLLK} from the assertion `DRAM_SDCKE`, the MMDC returns to normal operation.

The figure below shows the timing diagram of the hardware/software handshaking of LPMD/DVFS:

Figure 36-4. LPMD/DVFS Hardware/Software Handshaking

Note for self-refresh:

- As soon as LPMD or DVFS requests are detected by either hardware or software handshaking, the MMDC will deassert the `AXI ARREADY/AWREADY` signals immediately to block further requests from the system.
- In case of automatic self-refresh, the internal operating clock will be negated to save power.

36.4.7 Reset

36.4.7.1 Hard reset

When hard reset is asserted (`aresetn` is driven to "0") while warm reset is deasserted (`warm_reset` is driven to "0"), the entire MMDC will be initialized, including configuration/status registers and state machines.

In order to access the DDR device, the MMDC will then have to be reconfigured.

36.4.7.2 Warm reset

The MMDC supports warm reset signal. The warm reset signal must envelop the hard reset signal and then the MMDC will reset all the internal registers. The only registers that are not reset are those that are essential for returning it to normal operation without repeating the initialization sequence and without losing data stored in the memory (configuration/status registers won't be initialized).

For the successful operation of warm reset, the following steps must be performed:

- The MMDC must enter self-refresh mode. This can be achieved by either LPMD or DFVS requests
- Wait for LPMD or DVFS acknowledge
- Assert warm reset signal (i.e. drive warm_reset to "1")
- Assert hard reset signal (i.e. drive aresetn to "0")
- Deassert hard reset signal
- Deassert warm reset
- Get out of the LPMD/DVFS mode

Figure 36-5. Warm Reset Diagram

36.4.7.3 Software reset

The MMDC supports software reset. When software reset is configured then the MMDC will reset all the internal registers except those that are essential for returning to normal operation without repeating the initialization sequence or without losing data stored in the memory (configuration/status registers won't be initialized).

The following steps should be performed for successful operation of software reset:

- The MMDC should enter self-refresh mode. This can be achieved by either LPMD or DFVS request.
- Wait for LPMD or DVFS acknowledge

Functional Description

- Assert software reset, by setting MDMISC[RST]
- Get out of the LPMD/DVFS mode

Normal operation can be resumed.

36.4.8 Refresh Scheme

The MMDC supports various automatic refresh options which can be configured via the MDREF register.

The periodic auto refresh can be triggered by the following clocks:

- 32 kHz clock
- 64 kHz clock
- MMDC operating clock

The refresh scheme of the MMDC is flexible and allows the system to configure the desired AXI accesses delay/latency in each refresh cycle.

The table below shows an example of four configurations of the refresh cycles that will be handled by the MMDC. Each configuration meets a refresh rate of 3.9us (tREFI, refresh command every 3.9μs).

Table 36-8. MMDC Refresh Scheme

Option number	Description	REFR	REF_SEL	REF_CNT	DDR hang time
1	Issue 8 refresh commands every 31,250 ns	0x7 (8 refreshes)	0x0 (64 kHz)	not needed	tRFC * 8
2	Issue 4 refresh commands every 15,625ns	0x3 (4 refreshes)	0x1(32 kHz)	not needed	tRFC * 4
3	Issue 2 refresh commands every 7800ns	0x1(2 refreshes)	0x2 (REF_CNT)	7800/2.5 = 3120 (0xC30)	tRFC * 2
4	Issue 1 refresh command every 3900 ns	0x0 (1 refresh)	0x2 (REF_CNT)	3900/2.5 = 1560(0x618)	tRFC

36.4.9 Burst Length options towards DDR

The MMDC supports burst lengths which can be configured through MD+CTL[BL] as follows:

- In DDR3 mode, only burst length 8 can be used.
- In LPDDR2 mode, only burst length 4 can be used.

In DDR3 mode read/write accesses to the DDR are always 8 words (x16) and aligned in according to JEDEC standards.

In case of AXI INCREMENT, accesses that are not aligned the irrelevant data is masked in write accesses and ignored in read accesses. In case of AXI WRAP accesses, even if the access is not aligned, then the MMDC provides an internal optimization mechanism for better efficiency of the DDR data bus.

36.4.10 Exclusive accesses handling

The MMDC contains four exclusive monitors, each for dedicated ID as configured in MAEXIDR0 and MAEXIDR1.

- If legal read exclusive is received by the MMDC, the associated monitor is turned on.
- While the monitor is turned on upon legal write exclusive, the monitor will be turned off and the write will be completed successfully with EXOKAY.
- The following rules must be met for successful exclusive access:
 - Aligned access (the AXI address is aligned to the AXI size)
 - AXI single access (AXI burst length isn't greater than 1)
 - AXI size of up to 64 bits
 - AXI non-cachable access (i.e. ARCACHE[1]/AWCACHE[1] is equal "0" or ARCACHE[1]/AWCACHE[1] is equal "1" while ARCACHE[3:2]/AWCACHE[3:2] are equal "00")
 - AXI ID that matches one of the four exclusive IDs

Exclusive read behavior (first bullet also correct for non-exclusive accesses):

- In case of security violation, the read is blocked and is not sent to DDR. There are two options for response:
 - If ARCR_SEC_ERR_EN (MAARCR[30]) is high, SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.
- If AXI exclusive rules violation occurs (as described above), the read access is not blocked and is sent to DDR. The data will be fetched and be driven to the master, but the type of response may be unpredicted.
- If none of the above occurs, the read is sent to the DDR. The exclusive monitor will be turned on and the response is ExOKAY
- If additional legal AXI read exclusive is received with the same ID before the AXI exclusive write, the monitor will be updated with the latest attributes.

Exclusive write behavior (first bullet also correct for non-exclusive accesses):

- In case of security violation, the write is blocked and is not sent to DDR, but the monitor will be kept on. There are two options for response:
 - If ARCR_SEC_ERR_EN (MAARCR[30]) is high then SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.
- In case of AXI exclusive rules violation (as described above), the write is blocked and is not sent to DDR. In that case the type of response may be unpredictable.
- In case the exclusive write access has different AXI attributes, but the same ID as the read exclusive access, the write is blocked and is not sent to DDR and the monitor will be turned off. There are two options for response:
 - If ARCR_EXC_ERR_EN (MAARCR[28]) is high then SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.
- In case of regular (non exclusive) write access is received to the same address or overlapping addresses then the write will be sent to the DDR and the monitor will be turned off.
- In case of legal write exclusive access is received with the same attributes as the read exclusive access while the monitor is on (no write accesses occurred to the same address between the read exclusive and write exclusive), then the write is sent to DDR and the response is EXOKAY. But, if the legal write exclusive is received while the monitor is off, the write is blocked and there are two options for response.
 - If ARCR_EXC_ERR_EN (MAARCR[28]) is high then SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.

36.4.11 AXI Error Handling

The MMDC supports the AXI responses listed here.

- In case of AXI exclusive violation there are two options for response:
 - If MAARCR[28] is high then SLVError is issued towards the Master, Otherwise OKAY response is sent to the Master

NOTE

In case of read error MMDC drives zeros on the read data bus

36.5 Performance

36.5.1 Arbitration and reordering mechanism

36.5.1.1 Arbitration General

The following specifies arbitration and reordering flow in MMDC towards the DDR.

- AXI read and write accesses are sampled in the associated queue.
- Read/write arbitration is handled to select the winning access.
- Winning access is sampled in the reordering queue
- Reordering mechanism is handled between valid requests that reside in the reordering queue to select the access that will be dispatched to the DDR.
 - The reordering is held in order to optimize the accesses and to maximize the utilization of the DDR bus
 - As soon as the reordered access is completed (indicated by end of response or data phase) then it is erased from the associated queue and the MMDC is ready to receive the next available access from the master

In general, the reordering/arbitration mechanism is based on dynamic priority mechanism, which compares dynamic priorities between valid entries in the reordering queue and issues the entry with highest dynamic priority towards the DDR Logic.

The selection of the winning access is based on two modes, which can be activated together, as following:

- Real time channel mode:
 - Accesses with QoS='f' (i.e. awqos[3:0]/arqos[3:0] = "f") will bypass all other requests towards the DDR
- Dynamic scoring mode:
 - The arbitration mechanism is based on dynamic priority. Relevant for the accesses with QoS smaller than 'f' or when real time channel mode is disabled.

NOTE

Due to re-ordering and optimization mechanism (per different AXI ID), the transactions towards the DDR may be driven in a different ID order they were received by the AXI master. In similar way, the write response, read response or read data may be driven to the AXI master in a different ID order.

36.5.1.2 Real time channel mode

When real time mode is enabled (i.e. MAARCR[ARCR_RCH_EN] = "1") , all requests with QoS='f' (i.e. awqos[3:0]/aqos[3:0] = "f") will bypass all other pending accesses towards the DDR. This mode is enabled by default.

36.5.1.3 Dynamic scoring mode (Arbitration Winning Conditions)

The arbitration between pending accesses in the MMDC is handled according to a dynamic priority of each access.

The dynamic priority (may be also called score) is calculated according to a sum of some factors (final_score[3:0]), where part of them may be updated dynamically. The following will specify each scoring factor:

- MAARCR[ARCR_PAG_HIT] (Page hit score) - A static score which is taken into account in case the pending access has a page hit
- MAARCR[ARCR_ACC_HIT] (Access hit score) - A static score, which is taken into account in case the current access type (read/write) is the same as the access that has been dispatched to the DDR previously
- MAARCR[ARCR_DYN_JMP] (Dynamic jump score) - A dynamic score which is given to any pending access in case it was not chosen in the arbitration. The dynamic jump counter is limited by maximum value which is set in MAARCR[ARCR_DYN_MAX].
- QoS score which is indicated through a sideband 4bits AXI signals (awqos[3:0]/ aqqos[3:0]) and is driven by the AXI master per access

Note: In order to prevent an overflow in the total sum of scores, a clipping is held and selects the maximum score value of 'f' once a total scores sum is greater than 'f'.

The figure below shows the dynamic score calculations

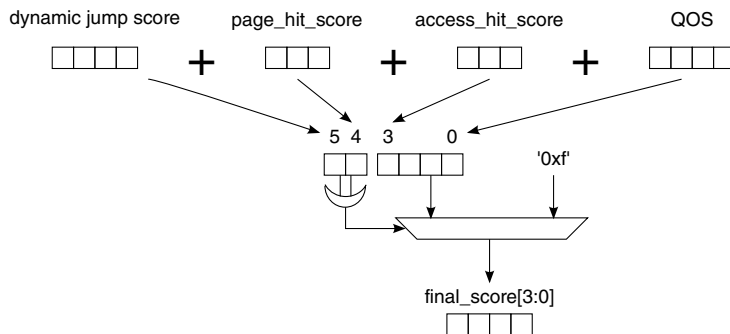

Figure 36-6. Dynamic score/priority calculation

36.5.1.4 Guarding (aging) mechanism

The guarding mechanism (may be also called aging) is used to prevent a starvation of accesses.

As soon as the dynamic jump score reaches its maximum value (MAARCR[ARCR_DYN_MAX]) then each time a pending request was not chosen in the arbitration, the "guarding" counter is incremented by 1. When the "guarding" counter reaches its predefined value, set in MAARCR[ARCR_GUARD], the associated request gets the highest priority and will be chosen in the next arbitration cycle towards the DDR unless a real time channel (i.e access with QoS ="f") is arrived.

Note: In case real time channel has arrived then the dynamic score of the non real time channels won't increment in order to prevent a case where the "guarding" counter of more than one access has reached its limit.

36.5.2 Prediction mechanism

When prediction mechanism is enabled (i.e by configuring MDMISC[MIF3_MODE]) then the MMDC predicts the chip-select, bank address and row address that is going to be issued towards the DDR before the access is physically dispatched towards DDR device.

That mechanism enables to prepare the DDR device with future accesses and improves the overall DDR performance.

This prediction mechanism operates in parallel to the reordering mechanism and may yield a prediction based on 3 levels of pending accesses:

1. Access in first stage of pipeline.
2. Valid access on AXI bus either read channel or write channel.
3. Valid access on special bus from arbitration - this access is chosen by the arbitration as the next miss access in its buffers

36.5.3 Special Optimization for accesses towards DDR3

In case an AXI read/write wrap non-aligned access is acknowledged in DDR3 mode with the same wrap boundary as the DDR wrap boundary then the MMDC will make an optimization and issue only one access towards the DDR, although all the accesses towards the DDR3 must be aligned.

For example: AXI write access with size of 128bits (awsiz[2:0]=3'b100), length of 4 (awlen[3:0]=4'b0011) towards DDR3 x64 (burst length 8). In that case the AXI wrap boundary is 16Bx4=64B (0x40) and the DDR3 wrap boundary is 8Bx8=64B (0x40). If, for example, the AXI access is towards AXI address with suffix of 0x10 (non-aligned to 64B boundary) then the MMDC will get from the AXI master the data that is associated with addresses 0x10, 0x20, 0x30, 0x0. The MMDC will rearrange internally the data so it

will match DDR3 alignment as following: 0x0, 0x10, 0x20, 0x30 and drive it in one access towards the DDR to address 0x0. The alternative was to issue two accesses towards the DDR with address 0x0 with different data masking

NOTE

In read wrap access the same optimization is handled, while as soon as the critical AXI word is fetched from the DDR then it is driven immediately to the AXI master without buffering. Based on the example above, the master expects to fetch first the data that is associated with address 0x10. Therefore the MMDC will issue read access from address 0x0 of the DDR and as soon as the data that is associated with address 0x10 is received then it will be driven back immediately to the master even before fetching the data of the further addresses.

36.6 MMDC Debug

36.6.1 Hardware debug monitor

The MMDC has a hardware debugging mechanism that monitors each access that is driven to the MMDC. Every time this mechanism is enabled (setting of MADPCR0[DBG_EN] to "1") then each access that will be dispatched to the DDR will be also observed in the I/O pads (i.e. over ipp_do_ddr_debug[50:0]). The content of this bus is described in the table below.

Table 36-9. Hardware monitor debugging

Signal Name	Number of Bits	Description
acc_addr	[31:0]	AXI ADDRESS of the selected access
acc_type	1	access type of the selected access. "0" indicates write. "1" indicates read.
acc_id	[15:0]	AXI transaction ID of the selected access
valid_strobe	1	indication for a valid request. This signal will be asserted for 1 clock cycle

The fields above are organized as following:

MMDC_DEBUG[50:0] = { 1'b0,valid_strobe,acc_id,access_type,addr }

These signals are sent to IOMUX, in IOMUX user can configure it to be output from the chip for debug usage.

36.6.2 Step By Step (SBS) software monitor

The MMDC has a Step By Step (SBS) software debugging mechanism that monitors each access that is driven to the MMDC. Every time this mechanism is triggered then one AXI access will be dispatched to the DDR and in parallel its attributes will be observed in a status register.

Once the "step by step" is enabled (i.e. MADPCR0[SBS_EN] is "1") then all accesses to the DDR device will be halted. This SBS feature is used during DDR SDCLK frequency scaling to prevent any accesses to the DDR device during the transition. Setting MADPCR0[SBS] to "1" will dispatch the access that is pending in the head of the MMDC queue (read or write). Upon every setting of MADPCR0[SBS]:

- The AXI attributes of the access will be sampled in the associated MASBS0 and MASBS1 fields
- MADPCR0[SBS] will be cleared automatically.

Setting again MADPCR0[SBS] to "1" will dispatch the next pending access in the MMDC queue.

NOTE

Setting the ARCR_ARB_REO_DIS bit in the MMDC0_MAARCR Register disables the SBS function

36.7 MMDC Profiling

The profiling mechanism provides the ability to calculate the DDR utilization together with read and write accesses statistics towards DDR per given period of time.

MMDC supports the following profiling counters:

- MADPSR0 (Total cycles count) - Indicates the total amount of cycles of the profiling period (up to 2^{32} cycles)
- MADPSR1 (Busy cycles count) - Indicates the total busy cycles during the profiling period. Busy cycles are any MMDC clock cycles where the internal state machine is not idle. If any read or write requests are pending in the FIFOs, the MMDC is not idle.
- MADPSR2 (Total read accesses count) - Indicates the total read accesses towards MMDC during the profiling period
- MADPSR3 (Total write accesses count) - Indicates the total write accesses towards MMDC during the profiling period

- MADPSR4 (Total read bytes count) - Indicates total bytes that were read from MMDC during the profiling period
- MADPSR5 (Total write bytes count) - Indicates total bytes that were written to MMDC during the profiling period

All profiling items described above are disabled by default. The following describes how to control the profiling mechanism:

- MADPCR0[DBG_EN] enables profiling.
- MADPCR0[PRF_FRZ] stops/freezes the profiling for example in case user wishes to perform DDR profiling per specific task. In order to resume profiling then MADPCR0[PRF_FRZ] should be cleared.
- MADPCR0[DBG_RST] clears all profiling counters
- MADPCR0[CYC_OVF] indicates whether an overflow occurred in the total cycles counter (i.e. total amount of cycles are greater than 2^{32}). This field can only be cleared by writing '0'.

Read/Write statistics can be collected per specific AXI ID (16bits). The following fields in MADPCR1 register determines which AXI-ID or AXI-ID's to monitor:

- PRF_AXI_ID defines which AXI IDs are taken for profiling. Default value is 16'h0.
- PRF_AXI_ID_MASK defines which bits from PRF_AXI_ID will be compared with AXI ID of read/write access. "1" means to monitor the associated bit and "0" means don't care. Default value is 16'h0000, meaning all IDs are not monitored

So the AXI-IDs to be monitored are calculated according to the following equation:

$$(AXI-ID \& PRF_AXI_ID_MASK) \text{ Xnor } (PRF_AXI_ID \& PRF_AXI_ID_MASK)$$

For example if AXI ID's between A100 till A1FF are wished to be monitored then the following should be configured:

- PRF_AXI_ID = A100
- PRF_AXI_ID_MASK = FF00

36.8 LPDDR2/LPDDR3 Refresh Rate Update and Timing Derating

LPDDR2 devices may have a temperature sensor that is used to determine an appropriate refresh rate and whether AC timing derating is required. The status of the temperature sensor can be read through MRR command from LPDDR2 MR4 register.

The MMDC supports refresh update and timing derating mechanism on the fly. The following steps specify how to use that mechanism:

- Perform periodic polling on MR4 LPDDR2 register using MRR command
- Read MDMRR register and analyze the MR4 indication
- In case refresh rate update and/or AC timing derating is required then it is needed to update MDREF and/or MDMR4[tRCD_DE, tRC_DE, tRAS_DE, tRP_DE, tRRD_DE] parameters

NOTE

MDMR4[tRCD_DE, tRC_DE, tRAS_DE, tRP_DE, tRRD_DE] are referred to the associated values configured at MDCFG3LP[tRC_LP, tRP_LP, tRCD_LP], MDCFG1[tRAS], MDCFG2[tRRD]

- Assert MDMR4[UPDATE_DE_REQ]
- When the MMDC switch to the new values then an acknowledge will be indicated at MDMR4[UPDATE_DE_ACK]

The enabled power saving features may be interfering with the MR4 reads. When these features are enabled the MMDC will automatically enter self-refresh and hence prevent the MR4 reads. Hence the Power Saving and refresh functionality should be disabled when SW performs the MR4 reads.

To disable the “Power Down” mode, set bit 0 of MAPSR (0x021B0404) to 1'b.

To disable the “Self-Refresh Power Down Timer” mode, set bits [15:8] of MDPDC (0x021B0004) to 0x00.

Overall Sequence to Perform MR4 reads

1. Set MAPSR to 0x00010107
2. Set MDPDC to 0x00020076
3. MRR command to read MR4
4. Write MDPDC to 0x00025576 to re-enable this feature
5. Write MAPSR to 0x00010106 to re-enable this feature

36.9 Changing MMDC SDCLK Frequency

Changing the MMDC SDCLK frequency when using either DDR3 or LPDDR2 can be done dynamically in software using the DVFS. Several important factors must be considered for each type of memory and whether transitioning between high and low frequency. The following sections highlight these factors and provide a step-by-step process when making frequency transitions on each type of memory.

36.9.1 Changing MMDC SDCLK Frequency Using DDR3/DDR3L Memories

This section provides the sequence of steps which should be followed to ensure a successful frequency transition when using DDR3/DDR3L memories.

NOTE

There are additional steps required to ensure that the ARM core and associated caches are in the correct state prior to any frequency transition or low power entry which are not detailed here. The user must assure that the ARM core or other bus masters are not accessing DDR during these transitions.

There are two general categories of frequency transitions – transitioning from high frequency to low frequency, and vice versa. High frequency is defined as all settable frequencies between 125 MHz and the maximum bus frequency, and low frequency is defined as all settable frequencies between 125 MHz and the low-power mode frequency of 24 MHz. Setting to a low frequency (below 125MHz) requires that the DDR3 device's delay line (DLL) be switched off, or be in DLL Off mode. Setting to a high frequency (above 125 MHz) requires that the DLL be switched on, or be in DLL On mode.

For further details refer to the DLL-off Mode chapter in the JEDEC standard.

A special consideration in changing the MMDC frequency on i.MX 6DualPlus/6QuadPlus is that all transitions are performed using the MMDC's Reorder Pass-through mode. Options for reordering and arbitration are selected by the ARCR_REO_DIS (bit 26) and ARCR_ARB_REO_DIS (bit 25) bits in the MMDC Core AXI Reordering Control Register (MMDC0_MAARCR). Two modes have been added in MMDC to disable the reorder function. The following table shows the selection of settings for reordering based on these bits (bit[26:25]) of the MMDC0_MAARCR register.

Table 36-10. Arbitration and Reordering Control in MMDC0_MAARCR

Register Bits	Settings	Notes
ARCR_REO_DIS MMDC0_MAARCR[25]	0 - MMDC reordering controls enabled 1 - MMDC reordering controls disabled (bypassed)	MMDC Reorder Pass-through mode: reordering is disabled when this bit is set.
ARCR_ARB_REO_DIS MMDC0_MAARCR[26]	0 - MMDC arbitration and reordering controls enabled 1 - MMDC arbitration and reordering controls disabled (Recommended)	Adopt Bypass mode: MMDC reorder and arbitration pipeline is totally bypassed when this bit is set.

When the ARCR_REO_DIS bit (MMDC0_MAARCR[25]) is set, the MMDC Reorder Pass-through mode is enabled. In this mode the DRAM access commands are still processed by the MMDC reorder and arbitration pipeline, but the commands are not

reordered. When the ARCR_ARB_REO_DIS bit (MMDC0_MAARCR[26]) is set the MMDC reorder and arbitration pipeline is totally bypassed. In this Adopt_Bypass mode the DRAM access latency is reduced and performance is improved.

The MMDC Reorder Pass-through mode is used for all frequency transitions, and ARCR_REO_DIS is set prior to the transition. In addition, this mode is used after transition for all frequency settings except for the maximum setting which, for the i.MX 6DualPlus/6QuadPlus, is 528 MHz. For this frequency setting, both arbitration and reordering are bypassed in the Adopt_Bypass mode.

The below table shows the relationship between the ARCR_REO_DIS and ARCR_ARB_REO_DIS bits.

Table 36-11. ARCR_ARB_REO_DIS and ARCR_REO_DIS bits of the MMDC0_MAARCR Register

ARCR_ARB_REO_DIS	ARCR_REO_DIS	Function	Notes
0	0	Reset Value – Both arbitration and reordering enabled	This is default value out of reset
0	1	Reordering only disabled	Reorder Pass-through mode enabled
1	x	Both arbitration and reordering disabled	Adopt_Bypass mode enabled. ARCR_REO_DIS has no impact since all AXI transactions bypass the reordering logic.

The recommended setting of these two bits based on frequency transition is shown in the following table.

Table 36-12. Required ARCR_ARB_REO_DIS and ARCR_REO_DIS Settings before and after Frequency Transitions

Transition	Before Transition	After Transition	Comments
	MMDC0_MAARCR [26:25] ¹	MMDC0_MAARCR [26:25]	
Initialized to 528 MHz at system boot	-	10 ²	Set to Adopt_Bypass mode after transition to 528 MHz during system boot
to other than 528MHz (including 24MHz)	01	01	Set to Reorder pass-through mode after transition
to 528MHz	01	10	Set to Adopt_Bypass mode after transition

1. Set to Reorder pass-through mode before frequency transition.
2. Set during MMDC Initialization at boot up for optimal performance.

In addition to setting the ARCR_REO_DIS bit prior to the MMDC frequency transition, the Step-by-Step (SBS) monitor (see section 46.6.2) is also enabled to block DDR accesses during the frequency transition. Setting the ARCR_ARB_REO_DIS bit disables the SBS function, therefore the Adopt_Bypass mode is used during transitions to allow the SBS logic to be enabled. The SBS function is only used during actual frequency transitions. Once frequency has switched the SBS is disabled to unblock DDR accesses.

NOTE

For DDR3 there is no need to perform any configuration of the MMDC1 registers for channel 1.

For further information please refer to EB828: MMDC and NoC Configuration for Optimal DDR3 Performance on the i.MX 6DualPlus/6QuadPlus available on NXP.com.

36.9.1.1 High Frequency to Low Frequency Transition (DLL On to DLL Off)

When switching from high frequency, including the maximum frequency, to low frequency the following steps should be executed.

NOTE

Unless specified otherwise, all registers cited in the switching procedures in this section and the following sections are in the MMDC0 bank.

1. Disable power-down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
2. Assert the MDSCR[CON_REQ] and wait for the MDSCR[CON_ACK] assertion.
3. Execute PRECHARGE ALL banks command (MDSCR[CMD] = 3b'101).
4. Execute MRW command to MR1 and disable RTT_Nom (A9, A6, A2 = 0) and DLL ON (A0 = 1, disabling the DLL)
5. Disable reordering (MAARCR[26:25] = 2b'01).
6. Execute MRW command to MR2 in order to update CWL to 6.
7. Execute MRW command to MR0 in order to update CL to 6.
8. Enter self-refresh mode. (See Self-refresh and Frequency change entry/exit.)
9. De-assert MDSCR[CON_REQ] signal.
10. Wait for self-refresh entry acknowledge (MAPSR[LPACK] = 1).
11. Bypass the Measurement Unit (set MPMUR0[MU_BYP_EN]) and follow steps outlined in ERR005778.
12. Perform a force measure by setting MPMUR0[FRC_MSR]. Wait for force measurement acknowledge MPMUR0[FRC_MSR] = 0.

13. Change to low frequency. (See Self-refresh and Frequency change entry/exit.)
14. Enable Step-by-Step Mode (MADPCR0[SBS_EN] = 1).
15. Keep reordering disabled (MAARCR[26:25] = 2b'01)
16. Exit self-refresh mode.
17. Assert MDSCR[CON_REQ] and wait for MDSCR[CON_ACK] assertion.
18. Update tCWL =6 and tCL =6 to meet the values configured in the DDR device.
(MDCGFG0, MDCFG1)
19. Set read latency (MDMISC[RALAT] = 2).
20. Enable pull-down resistors on DQS (through the I/O-MUX).
21. Disable ODT resistor (MPODTCTRL = 0).
22. Disable DQS gating (MPDGCTRL0[DG_DIS] = 1).
23. Disable Step-by-Step Mode (MADPCR0[SBS_EN] = 0).
24. De-assert MDSCR[CON_REQ].
25. Enable required power-down timers that were disabled, such as: MAPSR[PSD],
MDPDC[PWDT_1] , MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].

36.9.1.2 Low Frequency to High Frequency Transition (DLL Off to DLL On)

When switching from low frequency, including 24MHz low power mode, to high frequency the following steps should be executed.

1. Disable power-down timers that can conflict with this sequence, such as:
MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0],
MDPDC[PRCT_1].
2. Assert MDSCR[CON_REQ] and wait for MDSCR[CON_ACK] assertion.
3. Execute PRECHARGE ALL banks command (MDSCR[CMD] = 3b'101).
4. Enter self-refresh mode. (See Self-refresh and Frequency change entry/exit.)
5. De-assert MDSCR[CON_REQ].
6. Wait for self-refresh entry acknowledge (MMDCx_MAPSR[LPACK] = 1).
7. Disable reordering (MAARCR[26:25] = 2b'01).
8. Change to high frequency. (See Self-refresh and Frequency change entry/exit.)
9. Enable Step-by-Step Mode (MADPCR0[SBS_EN] = 1).
10. Exit self-refresh mode.
11. Optionally, force ZQ automatic calibration process by setting
MPZQHWCTRL[ZQ_HW_FOR] = 1 and setting MPZQHWCTRL[ZQ_MODE] =
2b'11.)
12. Enable DQS gating (MPDGCTRL0[DG_DIS] = 0)
13. Restore ODT setting in MPODTCTRL to original value.
14. Enable Measurement Unit by clearing MPMUR0[MU_BYP_EN]) per ERR005778.

15. Perform a force measure by setting MPMUR0[FRC_MSR]. Wait for force measurement acknowledge MPMUR0[FRC_MSR] = 0.
16. Disable pull-down resistors on DQS (through the I/O-MUX).
17. Restore read latency (MISC[RALAT]) to original value.
18. Restore calibration registers of MMDC BLOCK (if they were changed).
19. Assert MDSCR[CON_REQ] and wait for MDSCR[CON_ACK] assertion.
20. Execute MRW command to MR1 and enable RTT Nom (A9, A6, A2) and DLL ON (A0 = 0).
21. Execute MRW command to MR0 to reset the DLL (A8) and revert to CL values prior to entry.
22. Execute MRW command to MR2 to update CWL value.
23. Update tCWL and tCL to meet the values configured in the memory. (MDCFG0, MDCFG1)
24. Execute a ZQ command to the DDR3 device (MDSCR[CMD] = 3b'100).
25. Disable Step-by-Step Mode (MADPCRO[SBS_EN] = 0).
26. Transition to Adopt_ByPass mode to disable both arbitration and reordering (MAARCR[26:25] = 2b'10) if transitioning to highest frequency; otherwise switch to Reorder Pass-through mode to disable only reordering (MAARCR[26:25] = 2b'01).
27. De-assert MDSCR[CON_REQ].
28. Enable required power-down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].

36.9.2 Changing MMDC Frequency Using LPDDR2

This section provides the sequence of steps which should be followed to ensure a successful frequency transition when using LPDDR2 memories.

NOTE

In the procedure sequence provided in the following sections, the user should take caution in adjusting the parameters MMDC MDCFG0[tCL] and MDCFG1[tCWL] to ensure that these parameters match the RL/WL parameter of the LPDDR2 memory devices mode register 2 (MR2). If the MMDC parameters do not match those programmed in the LPDDR2 memory device, the memory interface will become unstable.

36.9.2.1 High Frequency to Low Frequency Transition

When switching from high frequency, including the maximum frequency, to low frequency the following steps should be executed.

1. Disable power-down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
2. Enter self-refresh mode. (See Self-refresh and Frequency change entry/exit.)
3. Wait for self-refresh entry acknowledge (MMDCx_MAPSR[LPACK] = 1).
4. Disable reordering (MAARCR[26:25] = 2b'01).
5. Enable Step-by-Step Mode (MADPCR0[SBS_EN] = 1).
6. Set read latency (MDMISC[RALAT] = 2).
7. Adjust LPDDR2 timings for low frequency operation: set MDCFG0, MDCFG1, MDCFG2, MDCFG33LP.
8. Read and store the measure count value MU_VAL=MPMUR0[MU_BYP_VAL].
9. Bypass the Measurement Unit by setting MPMUR0[MU_BYP_EN] and follow steps outlined in ERR005778.
10. Double the measure count value for the reduced frequency operation MPMUR0[MU_BYP_VAL] = 2*MU_VAL.
11. Perform a force measurement by setting MPMUR0[FRC_MSR] = 1. Wait for force measurement acknowledge MPMUR0[FRC_MSR] = 0.
12. Change to low frequency (See 27.4.2. DVFS Change Request Sequence Diagrams)
13. Exit self-refresh mode.
14. Enable required power down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
15. Disable Step-by-Step Mode (MADPCR0[SBS_EN] = 0).
16. Keep reordering disabled (MAARCR[26:25] = 2b'01); at max frequency disable both arbitration and reordering (MAARCR[26:25] = 2b'10).

36.9.2.2 Low Frequency to High Frequency Transition

When switching from low frequency to high frequency the following steps should be executed.

1. Disable power-down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
2. Enter self-refresh mode. (See Self-refresh and Frequency change entry/exit.)
3. Wait for self-refresh entry acknowledge (MMDCx_MAPSR[LPACK] = 1).
4. Disable reordering (MAARCR[26:25] = 2b'01).
5. Enable SBS (MADPCR0[SBS_EN] = 1).
6. Change to high frequency (See 27.4.2. DVFS Change Request Sequence Diagrams)
7. Restore read latency (MISC[RALAT]) to original value.
8. Restore LPDDR2 timings for high frequency operation: set MDCFG0, MDCFG1, MDCFG2, MDCFG33LP.

9. Enable Measurement Unit by clearing MPMUR0[MU_BYP_EN] per ERR005778.
10. Restore original MPMUR0[MU_BYP_VAL] =MU_VAL.
11. Perform a force measurement MPMUR0[FRC_MSR] =1. Wait for force measurement acknowledge MPMUR0[FRC_MSR] =0
12. Exit self-refresh mode.
13. Enable required power down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
14. Disable SBS (MADPCR0[SBS_EN] = 0).
15. Transition to Adopt_ByPass mode to disable both arbitration and reordering (MAARCR[26:25] = 2b'10) if transitioning to highest frequency; otherwise switch to Reorder Pass-through mode to disable only reordering (MAARCR[26:25] = 2b'01).

36.10 ODT Configuration

The MMDC supports one DRAM_ODT signal (DRAM_ODT for each DRAM_CS) in DDR3 mode in order to allow the DDR device to turn on/off its termination resistors. The MMDC suggests various configuration for the assertion of the ODT signal as well as configuration of several related timing.

MDOTC register controls the timing for the DRAM_ODT signals assertion.

NOTE

tODTLon determines the delay between DRAM_ODT signal and the associated RTT, where according to JEDEC standard it equals WL(write latency) - 2. Therefore, the value configured to MDOTC[tODTLon] field should correspond with the value configured to MDCGFG1[tCWL].

In precharge power down mode , when all banks are closed, the assertion of ODT corresponds with tAOFPD and tAONPD which are configured in MDOTC register.

The figure below shows timing diagram of DRAM_ODT and RTT signals while MPODTCTRL[0] is set to "1" (i.e. assertion of DRAM_ODT to the non active DRAM_CS in write access command) and MDOTC[tODTLon] is set to 4.

Figure 36-7. ODT - Timing Diagram DDR3 WL=6, BL=8

36.11 Calibration Process

The MMDC offers various calibration processes that are used to obtain better timing accuracy, board skew compensation and I/O pad driving strength adjustment. Each calibration process can be performed either automatically (hardware) or manually (software), though the manual method is typically reserved for debugging purposes. The following calibration processes are supported:

NOTE

Power saving features should be disabled before the calibration process begin. (Such as: MDPDC[PWDT#], MDPDC[PRCT#], MAPSR[PSD])

- ZQ calibration for external DDR device (in DDR3 through ZQ calibration command and in LPDDR2/LPDDR3 through MRW command)
 - Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh)
 - Can be handled manually at ZQ INIT
- ZQ calibration for i.MX DDR I/O pads for calibrating the DDR driving strength
 - The sequence can be handled automatically by hardware
 - The sequence can be handled step by step manually by software
- Read DQS gating calibration for DDR3 only. Adjustment of DQS gate with read preamble window. For further information refer to [Read DQS Gating Calibration](#)
- Read DQS gating calibration not supported for LPDDR2/LPDDR3
- Read data calibration. Adjustment of read DQS with read data byte. For further information refer to [Read Calibration](#)
- Write data calibration. Adjustment of write DQS with write data byte. For further information refer to [Write Calibration](#)

- Write leveling calibration. Adjustment of write DQS with CK (DDR differential clock). For further information refer to [Write leveling Calibration](#)
- Read fine tuning. Adjustment of up to 7 delay-line units for each read data bit.
- Write fine tuning. Adjustment of up to 3 delay-line units for each read data bit.

NOTE

Before starting any calibration process that involves the DDR3 device MPR mode or write leveling calibration, the following should be done:

- Disable the periodic refresh scheme (i.e. setting MDREF[REF_SEL] = "11") and then issue manual refresh command burst by configuring MDSCR[CMD]= 0x2. At the end of the calibration it is needed to enable the periodic refresh scheme.
- Disable the automatic power saving mode (i.e set MAPSR[PSD] = "1").

36.11.1 Delay-line

Each of the calibration processes controls several delay-lines for aligning data and strobos.

By default the delay-line is configured to generate 1/4 clock cycle of delay.

Moreover, when the operating clock is at the maximum allowed frequency, as appeared in the features list, then the delay-line is capable to issue a configurable delay of up to 1/2 clock cycle.

NOTE

At the beginning of the calibration process the initial value of the delay-line must be a valid value (i.e. the strobos must be somewhere among the associated data window) though it might not be the optimal value. The delay-line calibration should be done after Read DQS gating and write-leveling calibrations.

In order to generate an adequate delay during normal operation of the MMDC the delay-line is going through an automatic measurement process during the refresh period of the DDR device

36.11.2 ZQ calibration

The MMDC supports ZQ calibration process to calibrate the driving strength of the DDR I/O pads as well as driving ZQ commands to calibrate the external DDR device driving strength.

The first ZQ calibration (after booting the processor) is performed prior to turning on the MMDC. Subsequent ZQ calibrations may be executed in parallel to the DDR ZQ calibration. The MMDC supports 2 types of ZQ calibration commands: short and long.

The ZQ long calibration is executed during power up sequence, when existing self-refresh mode or when exiting slow precharge power down (DLL lock can be done in parallel). The ZQ short calibration is executed periodically according to a configurable timer defined by `MPZQHWCTRL[ZQ_HW_PER]`.

The field `MPZQHWCTRL[ZQ_MODE]` determines whether the MMDC will execute ZQ calibration to DDR I/O pads and/or issue ZQ short/long command to the DDR device.

The MMDC supports both automatic (hardware) and manual (software) ZQ calibration process for the DDR I/O pads.

It is possible to perform automatic (hardware) ZQ calibration only once (i.e. non-periodical) by asserting `MPZQHWCTRL[ZQ_HW_FOR]`.

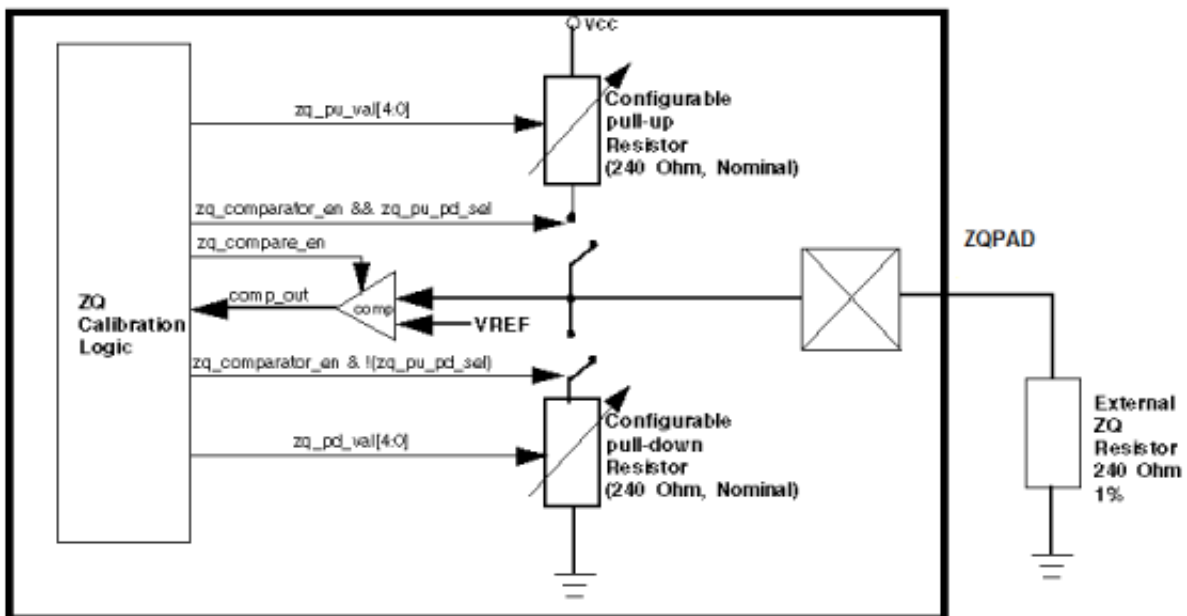

Figure 36-8. MMDC ZQ IF with PAD

36.11.2.1 ZQ automatic (hardware) calibration process

The ZQ automatic calibration lasts 11 steps. 5 steps for the pull up resistors calibration and 6 for the pull down resistors calibration.

The calibration control interface with ZQ pin is described below:

The calibration process is as follows:

36.11.2.1.1 ZQ automatic Pull-up calibration

The MMDC automatically performs a handshaking mechanism with the ZQ calibration pad as follows:

1. The MMDC drives `zq_comparator_en` to "1"
2. The MMDC waits few cycles according to `MPZQHWCTRL[EARLY_COMPARATOR_EN_TIMER]`
3. The MMDC drives `zq_pu_pd_sel` to "1" for indication of pull-up calibration and drives `zq_pu_val[4:0] = 5'b00000`
4. MMDC drives `zq_pu_val[4]` to "1"
5. MMDC asserts `zq_compare_en`
6. MMDC waits few cycles according to `MPZQSWCTRL[ZQ_CMP_OUT_SMP]` before sampling the comparator output (i.e `zq_comp_out`). If `zq_comp_out` is "1" then it means that the output voltage is greater than $V_{dd}/2$ (i.e. internal resistor is less than 240 ohm) and drives bit `zq_pu_val[4]` to "1" else it drives `zq_pu_val[4]` to "0"
7. MMDC deasserts `zq_compare_en`
8. MMDC repeats steps 4- 7 for `zq_pu_val` bits 3 to 0
9. MMDC drives ZQ calibration result to `MPZQHWCTRL[ZQ_HW_PU_RES]`
10. MMDC advances to pull-down calibration

36.11.2.1.2 ZQ automatic Pull-down calibration

1. The MMDC drives `zq_pu_pd_sel` to "0" for indication of pull-down calibration and drives `zq_pd_val[4:0] = 5'b00000`
2. MMDC drives `zq_pd_val[4]` to "1"
3. MMDC asserts `zq_compare_en`
4. MMDC waits few cycles according to `MPZQSWCTRL[ZQ_CMP_OUT_SMP]` before sampling the comparator output (i.e `zq_comp_out`). If `zq_comp_out` is "1" then it means that the output voltage is greater than $V_{dd}/2$ (i.e. internal resistor is less than 240 ohm) and drives bit `zq_pd_val[4]` to "0" else it drives `zq_pd_val[4]` to "1"
5. MMDC deasserts `zq_compare_en`
6. MMDC repeats steps 12- 15 for `zq_pd_val` bits 3 to 0
7. MMDC drives ZQ calibration result to `MPZQHWCTRL[ZQ_HW_PD_RES]`
8. MMDC deassert `zq_comparator_en` to indicate the completion of the ZQ calibration

36.11.2.2 ZQ software calibration process

The ZQ calibration can be done also in software. However since software ZQ calibration is much slower than hardware calibration it should be used mainly for debugging.

Software should configure the ZQ calibration parameters (Pull-up or Pull-down and their value) then assert the MPZQSWCTRL[ZQ_SW_FOR] bit. Then software should wait till ZQ_SW_FOR is de-asserted and use ZQ_SW_RES status bit in order to calculate the next ZQ calibration parameters.

36.11.2.3 ZQ calibration commands

Before the MMDC can issue a ZQCL/ZQCS command to the memory it should precharge all memory banks and wait tRP period. A single ZQ command can be issued to all devices as long as the devices don't share the same ZQ resistor.

When the MMDC issues the ZQ command it should also drive A10 (long or short command) and CS (0, 1 or both).

The MMDC must keep the memory lines quiet (except for CK) for the ZQ calibration time as defined in the Jedec (512 cycles for ZQCL after reset, 256 for other ZQCL and 64 for ZQCS).

36.11.3 Read DQS Gating Calibration

The read DQS gating calibration is used to adjust the read DQS gating with the middle of the read DQS preamble. The DQS gating includes a delay of up to 7 cycles (The delay is chosen according to two fields MPDGCTRL#[DG_HC_DEL#] and MPDGCTRL#[DG_DL_ABS_OFFSET#]

Each DQS has its own delay-line. The DQS gating process can be done for all DQS in parallel.

NOTE

In LPDDR2/LPDDR3 mode hardware Read DQS gating should be disabled and Pull-up/pull-down resistors on DQS/DQS# should be enabled while ODT resistors must be disconnected.

36.11.3.1 Hardware DQS Gating Calibration

- There are two modes of operations:
 - Calibration with the MPR (Multi Purpose Register)
 - Calibration with MMDC pre-defined values

36.11.3.1.1 Hardware DQS Calibration with MPR

The following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Enter the DDR device into MPR mode through MRS commands
3. Configure the MMDC to work with MPR mode by asserting `MPPDCMPR2[MPR_CMP]`
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. `MPRDDLCTL[RD_DL_ABS_OFFSET#]`) will place the read DQS somewhere inside the read DQ window
5. Start the calibration process by asserting `MPDGCTRL0[HW_DG_EN]`

36.11.3.1.2 Hardware DQS Calibration with pre-defined value

In case pre-defined mode is used, (i.e. `MPPDCMPR2[MPR_CMP]`) is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to `MPPDCMPR1[PDV1, PDV2]`
3. Issue write access to the external DDR device by setting `MPSWDAR0[SW_DUMMY_WR] = 1` (MMDC will generate internally write access without intervention of the system towards bank 0, row 0, column 0)
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. `MPRDDLCTL[RD_DL_ABS_OFFSET#]`) will place the read DQS somewhere inside the read DQ window
5. Start the calibration process by asserting `MPDGCTRL0[HW_DG_EN]`

The following steps will be executed automatically by the MMDC for both modes (MPR and Pre-defined value):

6. MMDC waits till the read DQS delay-line is updated with the absolute delay value for all bytes at `MPDGCTRL#[DG_HC_DEL#]` and `MPDGCTRL#[DG_DL_ABS_OFFSET#]` and also satisfying the $T_{mod} + 4$ requirement

7. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device).
8. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point. If the comparison passes then MMDC advances to step 14
9. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
10. MMDC increments the read DQS gating delay of each byte by half cycle (i.e. MPDGCTRL#[DG_HC_DEL#] + 1)
11. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device).
12. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8).
13. If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 9-12. If the comparison passes then MMDC stores the value of the temporary low boundary and advances to next step
14. MMDC increments the read DQS gating delay-line of each byte by half cycle (i.e. MPDGCTRL#[DG_HC_DEL#] + 1) and issue measurement process of the read DQS gating delay-line to update itself with the new value
15. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device).
16. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
17. If the comparison passes then it indicates that the read DQS gating is asserted inside the read preamble window and it is needed to repeat steps 14-16. If the comparison fails then MMDC stores the value of the temporary upper boundary and starts searching the adequate low and high boundaries
18. MMDC returns to the temporary low boundary minus half cycle and issue measurement process of the read DQS gating delay-line to update itself with the new value
19. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device).
20. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)

21. If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 22-23. If the comparison passes then MMDC stores the value of the adequate low boundary and advances to step 24
22. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
23. MMDC increments the read DQS gating delay of each byte by 1 (i.e. `MPDGCTRL#[DG_DL_ABS_OFFSET#] + 1`) and issue measurement process of the read DQS gating delay-line to update itself with the new value and advances to step 19
24. MMDC returns to the temporary upper boundary minus half cycle and issue measurement process of the read DQS gating delay-line to update itself with the new value
25. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to `MPDGCTRL0[DG_CMP_CYC]` assuming that the data has arrived from the DDR device.
26. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
27. If the comparison passes then it indicates that the read DQS gating is asserted inside the read preamble window and it is needed to repeat steps 28-29. If the comparison fails then MMDC stores the value minus 1 of the adequate upper boundary and advances to step 30
28. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
29. MMDC increments the read DQS gating delay of each byte by 1 (i.e. `MPDGCTRL#[DG_DL_ABS_OFFSET#] + 1`) and issue measurement process of the read DQS gating delay-line to update itself with the new value and advances to step 25
30. After the MMDC finds the window boundary (lower and upper) of each read data byte then it stores the average between lower and upper boundaries at the associated `MPDGCTRL#[DG_DL_ABS_OFFSET#]` and issue measurement process of the read DQS delay-line to update itself with the new value.
31. MMDC indicates that the read DQS gating calibration had finished by setting `MPDGCTRL0[HW_DG_EN] = 0`
32. Exit the DDR device from MPR mode through MRS command
33. Read the upper boundary that was found: `MPDGHWST#[HW_DG_UP#]`. This field is 11 bits, 7 LSB bits correspond to `MPDGCTRL#[DG_DL_ABS_OFFSET#]` upper limit value and 4 MSB bits correspond to `MPDGCTRL#[DG_HC_DEL#]` upper limit value.
34. Set `MPDGHWST#[HW_DG_UP#[6:0]]` to `MPDGCTRL#[DG_DL_ABS_OFFSET#]`.

35. Set (MPDGHWST#[HW_DG_UP#[10:7] - 1) to MPDGCTRL#[DG_HC_DEL#].
(We set the DQS gating value to be the upper limit value minus 1 half cycle)

36.11.3.2 SW read DQS gating Calibration

- There are two modes of operations:
- Calibration with the MPR (Multi Purpose Register)
- Calibration with MMDC pre-defined values

36.11.3.2.1 SW read Calibration with MPR

The following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Enter the DDR device into MPR mode through MRS commands
3. Configure the MMDC to work with MPR mode by asserting MPPDCMPR2[MPR_CMP]
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window

36.11.3.2.2 SW read Calibration with pre-defined value

In case pre-defined mode is used, (i.e. MPPDCMPR2[MPR_CMP]) is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access (with any legal DDR address) to external DDR device
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window

The following steps should be executed automatically by the MMDC for both modes (MPR and Pre-defined value):

5. Configure the read DQS delay-line to issue zero delay by setting MPDGCTRL#[DG_DL_ABS_OFFSET#] = 0 and MPDGCTRL#[DG_HC_DEL#] = 0

6. Force the delay line to measure itself and to issue the requested read delay by configuring `MPMUR[FRC_MSR] = 1`
7. Wait 16 DDR cycles till the read DQS delay-line is updated with the absolute delay value for all bytes
8. Issue read command (with the legal DDR address chosen in step 3) from the external DDR device
9. Waits 16 or 32 cycles (according to `MPDGCTRL0[DG_CMP_CYC]`) assuming that the data has arrived from the DDR device.
10. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point. If the comparison passes then advance to step 15
11. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
12. Increment the read DQS gating delay of each byte by half cycle (i.e. `MPDGCTRL#[DG_HC_DEL#] + 1`)
13. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to `MPDGCTRL0[DG_CMP_CYC]`) assuming that the data has arrived from the DDR device.
14. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 11 - 14. If the comparison passes then advance to step 15
15. Store the temporary lower boundary and start searching the temporary upper boundary
16. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
17. Increment the read DQS gating delay of each byte by half cycle (i.e. `MPDGCTRL#[DG_HC_DEL#] + 1`)
18. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to `MPDGCTRL0[DG_CMP_CYC]`) assuming that the data has arrived from the DDR device.
19. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8).
20. If the comparison passes then it indicates that the read DQS gating is asserted inside the read preamble window and it is needed to repeat steps 16-19. If the comparison fails then it is needed to store the value of the temporary upper boundary and starts searching the adequate low and high boundaries
21. Load the temporary low boundary minus half cycle into the associated `MPDGCTRL#[DG_HC_DEL#]`

22. Reset the read FIFO (to the inverted pre-defined/MPR value) and its pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
23. Increment the read DQS gating delay of each byte by 1 (i.e. `MPDGCTRL#[DG_DL_ABS_OFFSET#] + 1`) and force the delay line to measure itself and to issue the requested read DQS delay by configuring `MPMUR[FRC_MSR] = 1`
24. Issue read command to the external DDR devices and waits 16 or 32 cycles (according to `MPDGCTRL0[DG_CMP_CYC]`) assuming that the data has arrived from the DDR device.
25. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
26. If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 22-26. If the comparisons passes then advance to the next step.
27. Store the adequate lower boundary
28. Load the temporary upper boundary minus half cycle into the associated `MPDGCTRL#[DG_HC_DEL#]`
29. Reset the read FIFO (to the inverted pre-defined/MPR value) and its pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
30. Increment the read DQS gating delay of each byte by 1 (i.e. `MPDGCTRL#[DG_DL_ABS_OFFSET#] + 1`) and force the delay line to measure itself and to issue the requested read DQS delay by configuring `MPMUR[FRC_MSR] = 1`
31. Issue read command to the external DDR devices and waits 16 or 32 cycles (according to `MPDGCTRL0[DG_CMP_CYC]`) assuming that the data has arrived from the DDR device.
32. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
33. If the comparison passes then it is needed to repeat steps 29-32. If the comparisons fails then advance to the next step.
34. Reset the read FIFO (to the inverted pre-defined/MPR value) and its pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
35. Store the adequate upper boundary.
36. Keep the `MPDGCTRL#[DG_DL_ABS_OFFSET#]` value of the upper limit.
37. Set `MPDGCTRL#[DG_HC_DEL#] = (MPDGCTRL#[DG_HC_DEL#] - 1)`. (We set the DQS gating value to be the upper limit value minus 1 half cycle)
38. Issue the requested read DQS delay by configuring `MPMUR[FRC_MSR] = 1`
39. Exit the DDR device from MPR mode through MRS command

36.11.4 Read Calibration

The read calibration is used to adjust the read DQS with read data byte. It is assumed that the read DQS gating calibration process is completed prior to the read calibration.

NOTE

In DDR3 mode, the activation of the calibration is done by setting MPRDDLHWCTL[HW_RD_DL_EN].

NOTE

In LP2_x16 the activation of the calibration is done by setting MPRDDLHWCTL[HW_RD_DL_EN].

36.11.4.1 Hardware (automatic) Read Calibration

- There are two modes of operations:
- Calibration with the MPR (Multi Purpose Register)/DQ calibration(LPDDR2)
- Calibration with MMDC pre-defined values

36.11.4.1.1 Hardware (automatic) Calibration with MPR (DDR3) /DQ Calibration (LPDDR2)

The following steps should be executed:

1. Precharge all active banks (can be done through MDSCR) as required by the standard.
2. Enter the DDR device into MPR/DQ calibration mode through MRS/MRW commands.
3. Configure the MMDC to work with MPR/DQ calibration mode by asserting MPPDCMPR2[MPR_CMP].
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window.
5. Start the calibration process by asserting MPRDDLHWCTL[HW_RD_DL_EN].

36.11.4.1.2 Hardware (automatic) Calibration with pre-defined value

In case pre-defined mode is used, i.e. MPPDCMPR2[MPR_CMP] is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.

2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access to the external DDR device by setting MPSWDAR0[SW_DUMMY_WR] = 1 (MMDC will generate internally write access without intervention of the system towards bank 0, row 0, column 0)
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window
5. Start the calibration process by asserting MPRDDLHWCTL[HW_RD_DL_EN]

The following steps will be executed automatically by the MMDC for both modes (MPR and Pre-defined value):

6. MMDC waits till the read delay-line is updated with the absolute delay value for all bytes at MPRDDLCTL[RD_DL_ABS_OFFSET#] and also satisfying the Tmod + 4 requirement
7. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPRDDLHWCTL[HW_RD_DL_CMP_CYC]) assuming that the data has arrived from the DDR device.
8. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial read DQS isn't inside the read DQ window and the MMDC generates an error for the associated byte at MPRDDLHWCTL[HW_RD_DL_ERR#] . If the comparison passes then MMDC advances to next step.
9. MMDC resets the rd fifo (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
10. MMDC decrements the read delay line absolute offset of each byte by 1 (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) and issue measurement process of the read delay-line to update itself with the new value.
11. MMDC drives read command to the DDR external devices and waits 16 or 32 cycles (according to MPRDDLHWCTL[HW_RD_DL_CMP_CYC]) assuming that the data has arrived from the DDR device
12. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the low read boundary of the associated byte for each byte at MPRDDLHWST0/1[HW_RD_DL_LOW#] . If the comparison passes then MMDC repeats steps 9-11. If all read data comparisons fail then the MMDC advances to the next step
13. The MMDC start seeking the upper boundary and sets the read delay line absolute offset of each byte to the initial value + 1 as determined at step 4 and issue measurement process of the read delay-line to update itself with the new value

14. MMDC resets the rd fifo (to the inverted pre-defined value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
15. MMDC drives read command to the DDR external devices and waits 16 or 32 cycles (according to `MPRDDLHWCTL[HW_RD_DL_CMP_CYC]`) assuming that the data has arrived from the DDR device
16. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the upper read boundary of the associated byte for each byte at `MPRDDLHWST0/1[HW_RD_DL_UP#]` . If the comparison passes then MMDC increments the read delay line absolute offset of each byte by 1 (i.e. `MPRDDLCTL[RD_DL_ABS_OFFSET#]`) and issue measurement process of the read delay-line to update itself with the new value.
17. If all read data comparisons fail then the MMDC advances to the next step. otherwise, MMDC repeats steps 14-16.
18. After the MMDC finds the window boundary (lower and upper) of each read data byte then it stores the average between lower and upper boundaries at the associated `MPRDDLCTL[RD_DL_ABS_OFFSET#]` and issue measurement process of the read delay-line to update itself with the new value.
19. MMDC indicates that the read data calibration had finished by setting `MPRDDLHWCTL[HW_RD_DL_EN] = 0`
20. Exit the DDR device from MPR/DQ calibration mode through MRS/MRW commands

36.11.4.2 SW Read Calibration

- There are two modes of operations:
- Calibration with the MPR (Multi Purpose Register)/DQ calibration (LPDDR2)
- Calibration with MMDC pre-defined values

36.11.4.2.1 Calibration with MPR(DDR3)/DQ calibration(LPDDR2)

The following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Enter the DDR device into MPR/DQ calibration mode through MRS/MRW commands
3. Configure the MMDC to work with MPR/DQ calibration mode by asserting `MPPDCMPR2[MPR_CMP]`

4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. `MPRDDLCTL[RD_DL_ABS_OFFSET#]`) will place the read DQS somewhere inside the read DQ window

36.11.4.2.2 Calibration with pre-defined value

In case pre-defined mode is used, i.e. `MPPDCMPR2[MPR_CMP]` is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through `MDSCR`) as required by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to `MPPDCMPR1[PDV1, PDV2]`
3. Issue write access (with any legal DDR address) to external DDR device.
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. `MPRDDLCTL[RD_DL_ABS_OFFSET#]`) will place the read DQS somewhere inside the read DQ window

The following steps will be executed manually by SW for both modes (MPR/DQ calibration and Pre-defined value):

5. Force the delay line to measure itself and to issue the requested read delay by configuring `MPMUR[FRC_MSR] = 1`
6. Wait 16 DDR cycles till the read delay-line is updated with the absolute delay value for all bytes
7. Issue read command (with any legal DDR address) from the external DDR device
8. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial read DQS isn't inside the read DQ window. If the comparison passes then advance to next step.
9. Reset the rd fifo (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
10. Decrement the read delay line absolute offset of each byte by 1 (i.e. `MPRDDLCTL[RD_DL_ABS_OFFSET#]`)
11. Force the delay line to measure itself and to issue the requested read delay by configuring `MPMUR[FRC_MSR] = 1`
12. Issue read command (with the legal DDR address chosen in step 7) from the external DDR device and waits 16 or 32 cycles (according to `MPRDDLHWCTL[HW_RD_DL_CMP_CYC]`) assuming that the data has arrived from the DDR device
13. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the low read boundary of the associated byte at of each byte . If the

- comparison passes then repeat steps 9-12. If all read data comparisons fail then advance to the next step.
14. Start seeking the upper boundary and set the read delay line absolute offset of each byte to the initial value + 1 as determined at step 4
 15. Force the delay line to measure itself and to issue the requested read delay by configuring `MPMUR[FRC_MSR] = 1`
 16. Resets the rd fifo (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
 17. Issue read command (with the legal DDR address chosen in step 7) from the external DDR device
 18. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the upper read boundary of the associated byte at of each byte. If the comparison passes then increment the read delay line absolute offset of each byte by 1 (i.e. `MPRDDLCTL[RD_DL_ABS_OFFSET#]`)
 19. Force the delay line to measure itself and to issue the requested read delay by configuring `MPMUR[FRC_MSR] = 1`
 20. If all read data comparisons fail then advance to the next step, else repeat steps 16-19
 21. After finding the window boundary (lower and upper) of each read data byte then calculate the average between lower and upper boundaries and store the associated average at `MPRDDLCTL[RD_DL_ABS_OFFSET#]`
 22. Force the delay line to measure itself and to issue the requested read delay by configuring `MPMUR[FRC_MSR] = 1`
 23. Exit the DDR device from MPR/DQ calibration mode through MRS/MRW commands.

36.11.5 Write Calibration

The write calibration is used to adjust the write DQS with write data byte. It is assumed that the read calibration process is completed prior to the write calibration.

NOTE

In DDR3_x64 and LP2_1ch_x64 modes, the activation of the calibration is done by setting `MPWRDLHWCTL0[HW_WR_DL_EN]`

NOTE

In LP2_x16, LP2_x32 the activation of the calibration of each channel is done by setting `MPWRDLHWCTL0[HW_WR_DL_EN]` and `MPWRDLHWCTL0[HW_WR_DL_EN]`

36.11.5.1 HW (automatic) Write Calibration

The following steps should be executed:

1. Make sure that the initial value that is configured in the write delay line absolute offset of each byte (i.e. `MPWRDLCTL[WR_DL_ABS_OFFSET#]`) will place the write DQS somewhere inside the write DQ window
2. Configure the pre-defined value, which reflects the value that will be written and compared through the write calibration, to `MPPDCMPR1[PDV1, PDV2]`
3. Assert `MPWRDLHWCTL0[HW_WR_DL_EN]`

The following steps will be executed automatically:

4. MMDC waits till the write delay-line is updated with the absolute delay value for all bytes at `MPWRDCTL[WR_DL_ABS_OFFSET#]`
5. MMDC drives write command to the external DDR devices (to bank 0 address 0) and waits 16 or 32 cycles (according to `MPWRDLHWCTL[HW_WR_DL_CMP_CYC]`) assuming that the data has arrived to the DDR device.
6. MMDC drives read command to the same address from the external DDR
7. MMDC compares the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial write DQS isn't inside the write DQ window and the MMDC generates an error for the associated byte at `MPWRDLHWCTL[HW_WR_DL_ERR#]` . If the comparison passes then MMDC advances to next step.
8. MMDC resets the rd fifo (to the inverted pre-defined value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
9. MMDC decrements the write delay line absolute offset of each byte by 1 (i.e. `MPWRDLCTL[WR_DL_ABS_OFFSET#]`) and issue measurement process of the write delay-line to update itself with the new value.
10. MMDC drives write command to the external DDR devices (to bank 0 address 0) and waits 16 or 32 cycles (according to `MPWRDLHWCTL[HW_WR_DL_CMP_CYC]`) assuming that the data has arrived to the DDR device
11. MMDC drives read command to the same address from the external DDR
12. MMDC compares the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the low write boundary of the associated byte of each byte at `MPWRDLHWST0/1[HW_WR_DL_LOW#]` . If the comparison passes then MMDC repeats steps 8-11. If all data comparisons fail then the MMDC advances to the next step

13. The MMDC start seeking the upper boundary and sets the write delay line absolute offset of each byte to the initial value + 1 as determined at step 4 and issue measurement process of the write delay-line to update itself with the new value
14. MMDC resets the rd fifo (to the inverted pre-defined value) and its pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
15. MMDC drives write command to the external DDR devices (to bank 0 address 0) and waits 16 or 32 cycles (according to `MPWRDLHWCTL[HW_WR_DL_CMP_CYC]`) assuming that the data has arrived to the DDR device.
16. MMDC drives read command to the same address from the external DDR
17. MMDC compares the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the upper write boundary of the associated byte of each byte at `MPWRDLHWST0/1[HW_WR_DL_UP#]` . If the comparison passes then MMDC increments the write delay line absolute offset of each byte by 1 (i.e. `MPWRDLCTL[WR_DL_ABS_OFFSET#]`) and issue measurement process of the write delay-line to update itself with the new value.
18. MMDC repeats steps 14-17. If all data comparisons fail then the MMDC advances to the next step
19. .After the MMDC finds the window boundary (lower and upper) of each write data byte then it stores the average between lower and upper boundaries at the associated `MPWRDLCTL[WR_DL_ABS_OFFSET#]` and issue measurement process of the write delay-line to update itself with the new value.
20. MMDC indicates that the write data calibration had finished by setting `MPWRDLHWCTL[HW_WR_DL_EN] = 0`

36.11.5.2 SW Write Calibration

The following steps should be executed:

NOTE

It is recommended to perform the write calibration using the HW method. The SW method is provided for debug purposes only.

1. Make sure that the initial value that is configured in the write delay line absolute offset of each byte (i.e. `MPWRDLCTL[WR_DL_ABS_OFFSET#]`) will place the write DQS somewhere inside the write DQ window
2. Configure the pre-defined value, which reflects the value that will be written and compared through the write calibration, to `MPPDCMPR1[PDV1, PDV2]`
3. Force the delay line to measure itself and to issue the requested write delay by configuring `MPMUR[FRC_MSR] = 1`

4. Wait 16 DDR cycles till the write delay-line is updated with the absolute delay value for all bytes
5. Issue write command to any legal DDR address of the external DDR device
6. Issue read command, to the address written previously, from the external DDR device
7. Compare the read data byte to the associated byte in the pre-defined value for all bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial write DQS isn't inside the write DQ window. If the comparison passes then advance to next step.
8. MMDC resets the rd fifo (to the inverted pre-defined value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
9. Decrement the write delay line absolute offset of each byte by 1 (i.e. `MPWRDLCTL[WR_DL_ABS_OFFSET#]`)
10. Force the delay line to measure itself and to issue the requested write delay by configuring `MPMUR[FRC_MSR] = 1`
11. Issue write command to any legal DDR address of the external DDR device
12. Issue read command, to the address written previously, from the external DDR device
13. Compare the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the low write boundary of the associated byte of each byte at `MPWRDLHWST0/1[HW_WR_DL_LOW#]` . If the comparison passes then repeat steps 8-12. If all data comparisons fail then advance to the next step.
14. Start seeking the upper boundary and set the write delay line absolute offset of each byte to the initial value + 1
15. Force the delay line to measure itself and to issue the requested write delay by configuring `MPMUR[FRC_MSR] = 1`
16. Reset the rd fifo (to the inverted pre-defined value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
17. Issue write command to any legal DDR address of the external DDR device
18. Issue read command, to the address written previously, from the external DDR device
19. Compare the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the upper write boundary of the associated byte of each byte at `MPWRDLHWST0/1[HW_WR_DL_UP#]`. If the comparison passes then increment the write delay line absolute offset of each byte by 1.
20. Force the delay line to measure itself and to issue the requested write delay by configuring `MPMUR[FRC_MSR] = 1`
21. If all read data comparisons fail then advance to the next step else repeat steps 16-20.

22. .After finding the window boundary (lower and upper) of each write data byte then calculate the average between lower and upper boundaries and store the associated average at MPWRDLCTL[WR_DL_ABS_OFFSET#]
23. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR[FRC_MSR] = 1

36.11.6 Write leveling Calibration

The write leveling calibration can generate a delay between the clock and the associate DQS of up to 3 cycles as following: $(WL_DL_ABS_OFFSET/256 * cycle) + (WL_HC_DEL * half\ cycle) + (WL_CYC_DEL * cycle)$. Write leveling calibration can be executed automatically(HW) or manually (SW).

The automatic calibration process can only detect the optimal DQS to clock delay to within 1 cycle. In extreme cases in which the DDR3 memory is placed far from the microcontroller (long address/command/clock trace lengths), the skew between the DQS and clock may exceed 1 cycle. If this is the case, it is the user's responsibility to both understand that their design causes the DQS to clock skew to exceed 1 cycle and to indicate this manually in the MPWLDECTRL0/1[WL_CYC_DEL#]. It is highly recommended to keep the DDR3 memory as close to the microcontroller as possible, especially in embedded system designs. When using fly-by topology, the user should calculate the PCB flight time of the clock signal to the furthest placed DDR3 memory to ensure less than 1 cycle skew between DQS and clock.

NOTE

In LPDDR2 mode Write-leveling calibration should be disabled.

36.11.6.1 Hardware Write Leveling Calibration

The following steps should be executed:

1. Configure the external DDR device to enter write leveling mode through MRS command
2. Activate the DQS output enable by setting MDSCR[WL_EN]
3. Active automatic calibration by setting MPWLGCR[HW_WL_EN]

The following steps will be executed automatically by the MMDC:

4. MMDC enters write leveling mode, counts 25 + 15 cycles and drives the DQS pads as output while the DQ pads will remain inputs. In parallel the MMDC configures the write leveling delay line to "0" (i.e.

- MPWLDECTRL0[WL_DL_ABS_OFFSET#] = 0) and issue measurement process of the writ-leveling delay-line to update itself with the new value
5. MMDC drives one DQS pulse to the DDR external device
 6. MMDC waits 16 cycles (to guarantee that the DQ prime data is stable) and samples the associated prime DQ bit (for example for DQS1 the MMDC samples DQ[8])
 7. MMDC increments the write leveling delay line by 1/8 cycle and perform measurement process in order to load the updated value to the associated delay-line
 8. MMDC repeats steps 5-7 till the write leveling delay is 1 cycle
 9. MMDC checks the 8 bit prime DQ results for each DQS and finds the first transition from 0 to 1. If no transition is found then the MMDC indicates an error at MPWLGCR[HW_WL_ERR#]
 10. MMDC stores the value that issues the last "0" on the prime DQ before the transition and loads it to the write leveling delay-line. The MMDC initiates a fine-tune process by incrementing the delay-line values by 1 step (which is 1/256 part of a cycle) till detecting the most accurate transition from 0 to 1
 11. Upon completion of this process the MMDC de-asserts the MPWLGCR[HW_WL_EN] and update the most accurate value of the delay-line at the associated MPWLDECTRL#[WL_DL_ABS_OFFSET#]
 12. MMDC perform measurement process in order to load the most accurate value to the associated delay-line
 13. User should issue MRS command to exit write leveling mode
 14. The user should read the results of the associated delay-line at MPWLDECTRL#[WL_DL_ABS_OFFSET#] and in case the user estimates that the reasonable delay may be above 1 cycle then the user should indicate it at MPWLDECTRL#[WL_CYC_DEL#]. Moreover the user should indicate it in MDMISC[WALAT] field. For example, if the result of the write leveling calibration is 100/256 parts of a cycle, but the user estimates that the delay is above 2 cycles then MPWLDECTRL#[WL_CYC_DEL#] should be configured to 2, so the total delay will be 2 and 100/256 parts of a cycle
 15. Return the DQS output enable to functional mode by deasserting MDSCR[WL_EN]

36.11.6.2 SW Write Leveling Calibration

The following steps should be executed:

NOTE

It is recommended to perform the write calibration using the HW method. The SW method is provided for debug purposes only.

1. Configure the external DDR device to enter write leveling mode through MRS command
2. Activate the DQS output enable by setting MDSCR[WL_EN]
3. Set the write-leveling delay-line offset to "0" by configuring MPWLDECTRL0[WL_DL_ABS_OFFSET#] = 0
4. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
5. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1 together with MPWLGCR[SW_WL_CNT_EN] = 1
6. Issue an IP read command from MPWLGCR. If MPWLGCR[SW_WL_EN] = 0 then the SW write-leveling result is valid at MPWLGCR[WL_SW_RES#].
7. Increment the write leveling delay line by 1/8 cycle (i.e add 0x20 to {MPWLDECTRL0[WL_HC_DEL#],MPWLDECTRL0[WL_DL_ABS_OFFSET#]})
8. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
9. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1
10. Repeat steps 6-9 till the edge of CK was detected (i.e the write-leveling result switched from "0" to "1")
11. Store the value that issues the last "0" on the prime DQ before the transition and load it to the write leveling delay-line and start fine tuning process to detect the exact switch from "0" to "1"
12. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
13. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1
14. Issue a IP read command from MPWLGCR. If MPWLGCR[SW_WL_EN] = 0 then the SW write-leveling result is valid at MPWLGCR[WL_SW_RES#].
15. Increment the write leveling delay line by 1 step (i.e add 0x01 to MPWLDECTRL0[WL_DL_ABS_OFFSET#])
16. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
17. Issue an IP read command from MPWLGCR. If MPWLGCR[SW_WL_EN] = 0 then the SW write-leveling result is valid at MPWLGCR[WL_SW_RES#].
18. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1
19. Repeat steps 15-18 till the exact edge of CK was detected (i.e the write-leveling result switched from "0" to "1")
20. Issue MRS command to exit write leveling mode
21. Return the DQS output enable to functional mode by deasserting MDSCR[WL_EN]

36.11.7 Write fine tuning

Write fine tuning is an additional circuit that provides the ability to fine tune the timing of each of the DQ/DM bits (relative to DQS) by up to 100 ps. To use the write fine tuning, select the number of delay units in each DQ/DM I/O (maximum 3 delay units of around 30-35 ps each). The delay can be configured independently for each DQ/DM. This configuration is controlled by the MPWRDQBYnDL registers.

36.11.8 Read fine tuning

Read fine tuning is an additional circuit that provides the ability to fine tune the timing of each coming dq bits (relative to coming dqs) by up to +/-100 ps.

This is done by reducing the delay between the incoming rd_dqs by 100 ps and adding a configurable delay of up to 200 ps (6 delay units of around 30-35 ps each) for each DQ input. The delay can be configured independently for each DQ. The calibration of this mechanism can be done only by writing & reading data from the memory. Controlled by register MPRDDQBY#DL.

36.11.9 ZQ Fine Tuning

An offset can be added to the PU /PD values determined by the ZQ calibration process. The offset range is programmable from -7 to +7, controlled by the MMDC_MPPDCMPR2[ZQ_PU_OFFSET] and MMDC_MPPDCMPR2[ZQ_PD_OFFSET] fields. The offset is enabled/disabled by MMDC_MPPDCMPR2[ZQ_OFFSET_EN]. See MMDC_MPPDCMPR2 register for more information.

36.11.10 Duty cycle adjustment

Duty cycle adjustments can be made to the SDCLKx and SDQSx signals, see the MMDCx_MPDCCR register for more information.

36.12 MMDC Memory Map/Register Definition

The Memory Map is shown below.

NOTE

The terms *clocks* and *cycles* are used interchangeably and refer to the clock period of the main ddr clock (mmdc_axi_clk_root), commonly referred to as the DDR frequency.

Address: 21B_0000h base + 0h offset = 21B_0000h

MMDC_MDCTL field descriptions

Field	Description
31 SDE_0	MMDC Enable CS0. This bit enables/disables accesses from the MMDC toward Chip Select 0. The reset value of this bit is "0" (i.e No clocks and clock enable will be driven to the memory). At the enabling point the MMDC will perform an initialization process (including a delay on RESET and/or CKE) for both chip selects. The initialization length depends on the configured memory type. 0 Disabled 1 Enabled
30 SDE_1	MMDC Enable CS1. This bit enables/disables accesses from the MMDC toward Chip Select 1. The reset value of this bit is "0" (i.e No clocks and clock enable will be driven to the memory). At the enabling point the MMDC will perform an initialization process (including a delay on RESET and/or CKE) for both chip selects. The initialization length depends on the configured memory type. 0 Disabled 1 Enabled
29–27 Reserved	This read-only field is reserved and always has the value 0.
26–24 ROW	Row Address Width. This field specifies the number of row addresses used by the memory array. It will affect the way an incoming address will be decoded. Settings 110-111 are reserved 000 11 bits Row 001 12 bits Row 010 13 bits Row 011 14 bits Row 100 15 bits Row 101 16 bits Row
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 COL	Column Address Width. This field specifies the number of column addresses used by the memory array. It will determine how an incoming address will be decoded. 0x0 9 bits column 0x1 10 bits column 0x2 11 bits column 0x3 8 bits column 0x4 12 bits column 0x5-0xF Reserved
19 BL	Burst Length. This field determines the burst length of the DDR device. In LPDDR2 mode the MMDC supports burst length 4. In DDR3 mode the MMDC supports burst length 8. 0 Burst Length 4 is used 1 Burst Length 8 is used
18 Reserved	This read-only field is reserved and always has the value 0.
17–16 DSIZ	DDR data bus size. This field determines the size of the data bus of the DDR memory

MMDC_MDPDC field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–28 PRCT_1	Precharge Timer - Chip Select 1. This field determines the amount of idle cycle for which chip select 1 will be automatically precharged. The amount of cycles are determined according to the PRCT Field Encoding table above.
27 Reserved	This read-only field is reserved and always has the value 0.
26–24 PRCT_0	Precharge Timer - Chip Select 0. This field determines the amount of idle cycle for which chip select 0 will be automatically precharged. The amount of cycles are determined according to the table below.
23–19 Reserved	This read-only field is reserved and always has the value 0.
18–16 tCKE	CKE minimum pulse width. This field determines the minimum pulse width of CKE. 0x0 1 cycle 0x1 2 cycles 0x6 7 cycles 0x7 8 cycles
15–12 PWDT_1	Power Down Timer - Chip Select 1. This field determines the amount of idle cycle for which chip select 1 will be automatically get into precharge/active power down. The amount of cycles are determined according to the PWDT Field Encoding table above.
11–8 PWDT_0	Power Down Timer - Chip Select 0. This field determines the amount of idle cycle for which chip select 0 will be automatically get into precharge/active power down. The amount of cycles are determined according to the PWDT Field Encoding table above.
7 SLOW_PD	Slow/fast power down. In DDR3 mode this field is referred to slow precharge power-down.

Table continues on the next page...

MMDC_MDPDC field descriptions (continued)

Field	Description
	LPDDR2 mode: This field is not relevant and should remain in its default reset value. NOTE: Memory should be configured the same. 0 Fast mode. 1 Slow mode.
6 BOTH_CS_PD	Parallel power down entry to both chip selects. When power down timer is used for both chip-selects (i.e PWDT_0 and PWDT1 don't equal "0"), then if this bit is enabled, the MMDC will enter power down only if the amount of idle cycles of both chip selects was obtained. 0 Each chip select can enter power down independently according to its configuration. 1 Chip selects can enter power down only if the amount of idle cycles of both chip selects was obtained.
5–3 tCKSRX	Valid clock cycles before self-refresh exit. This field determines the amount of clock cycles before self-refresh exit. 0x0 0 cycle 0x1 1 cycles 0x6 6 cycles 0x7 7 cycles
tCKSRE	Valid clock cycles after self-refresh entry. This field determines the amount of clock cycles after self-refresh entry. 0x0 0 cycle 0x1 1 cycles 0x6 6 cycles 0x7 7 cycles

36.12.3 MMDC Core ODT Timing Control Register (MMDC_MDOTC)

For further information see [ODT Configuration](#) .

MMDC_MDOTC field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.
29–27 tAOFPD	Asynchronous RTT turn-off delay (power down with DLL frozen). This field determines the time between termination circuit starts to turn off the ODT resistance till termination has reached high impedance. LPDDR2 mode: This field is not relevant and should remain in its default reset value. 0x0 1 cycle 0x1 2 cycles 0x6 7 cycles 0x7 8 cycles
26–24 tAONPD	Asynchronous RTT turn-on delay (power down with DLL frozen). This field determines the time between termination circuit gets out of high impedance and begins to turn on till ODT resistance are fully on. LPDDR2 mode: This field is not relevant and should remain in its default reset value. 0x0 1 cycle 0x1 2 cycles 0x6 7 cycles 0x7 8 cycles
23–20 tANPD	Asynchronous ODT to power down entry delay. In DDR3 should be set to tCWL-1 LPDDR2 mode: This field is not relevant and should remain in its default reset value. 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF 16 clocks
19–16 tAXPD	Asynchronous ODT to power down exit delay. In DDR3 should be set to tCWL-1 LPDDR2 mode: This field is not relevant and should remain in its default reset value. 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF 16 clocks
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 tODTLon	ODT turn on latency. This field determines the delay between ODT signal and the associated RTT, where according to JEDEC standard it equals WL(write latency) - 2. Therefore, the value that is configured to tODTLon field should correspond the value that is configured to MDCGFG1[tCWL] LPDDR2 mode: This field is not relevant and should remain in its default reset value. 0x0 - 0x1 Reserved 0x2 2 cycles 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles

MMDC_MDMISC field descriptions

Field	Description
31 CS0_RDY	External status device on CS0. This is a read-only status bit, that indicates whether the external memory is in wake-up period. 0 Device in wake-up period. 1 Device is ready for initialization.

Table continues on the next page...

MMDC_MDMISC field descriptions (continued)

Field	Description
30 CS1_RDY	External status device on CS1. This is a read-only status bit, that indicates whether the external memory is in wake-up period. 0 Device in wake-up period. 1 Device is ready for initialization.
29–22 Reserved	This read-only field is reserved and always has the value 0.
21 CK1_GATING	Gating the secondary DDR clock. When this bit is asserted then the MMDC will disable the secondary DDR clock 0 MMDC drives two clocks toward the DDR memory 1 MMDC drives only one clock toward the DDR memory (CK0)
20 CALIB_PER_CS	Number of chip-select for calibration process. This bit determines the chip-select index that the associated calibration is targetted to. Relevant for read, write, write leveling and read DQS gating calibrations 0 Calibration is targetted to CS0 1 Calibration is targetted to CS1
19 ADDR_MIRROR	Address mirroring. NOTE: This feature is not supported for LPDDR2/LPDDR3 memories. But only for DDR2/DDR3 memories. For further information see Address mirroring . 0 Address mirroring disabled. 1 Address mirroring enabled.
18 LHD	Latency hiding disable. This is a debug feature. When set to "1" the MMDC will handle one read/write access at a time. Meaning that the MMDC pipe-line will be limited to 1 open access (next AXI address phase will be acknowledged if the current AXI data phase had finished) 0 Latency hiding on. 1 Latency hiding disable.
17–16 WALAT	Write Additional latency. In case the write-leveling calibration process indicates a delay of greater than one-eighth a clock cycle (between CK and any of the DQS strobe lines), then this field must be configured accordingly. This field will add delay on the obe I/O control, which will compensate on the additional write leveling delay on DQS and prevent the DQS from being cropped. NOTE: The purpose of WALAT is to add time delay at the end of a burst write operation to ensure that the JEDEC time specification for Write Post Ambly Delay (tWPST) is met (DQS strobe is held low at the end of a write burst for > 30% a clock cycle before it is released). If the value of any of the WL_DL_ABS_OFFSETn register fields are greater than '1F', WALAT should be set to '1' (cycle additional delay). WALAT should be further increased for any full cycle delays added by the WL_CYC_DELn register fields. 0x0 No additional latency required. 0x1 1 cycle additional delay 0x2 2 cycles additional delay 0x3 3 cycles additional delay

Table continues on the next page...

MMDC_MDMISC field descriptions (continued)

Field	Description
15–13 Reserved	This read-only field is reserved and always has the value 0.
12 BI_ON	Bank Interleaving On. This bit controls the organization of the bank, row and column address bits. For further information see Address decoding . 0 Banks are not interleaved, and address will be decoded as bank-row-column 1 Banks are interleaved, and address will be decoded as row-bank-column
11 LPDDR2_S2	LPDDR2 S2 device type indication. In case LPDDR2 device is used (DDR_TYPE = 0x1), this bit will indicate whether S2 or S4 device is used. This bit should be cleared in DDR3 mode 0x0 LPDDR2-S4 device is used. 0x1 LPDDR2-S2 device is used.
10–9 MIF3_MODE	Command prediction working mode. This field determines the level of command prediction that will be used by the MMDC 00 Disable prediction. 01 Enable prediction based on : Valid access on first pipe line stage. 10 Enable prediction based on: Valid access on first pipe line stage, Valid access on axi bus. 11 Enable prediction based on: Valid access on first pipe line stage, Valid access on axi bus, Next miss access from access queue.
8–6 RALAT	Read Additional Latency. This field determines the additional read latency which is added to CAS latency and internal delays for which the MMDC will retrieve the read data from the internal FIFO. This field is used to compensate on board/chip delays. NOTE: In LPDDR2 mode 2 extra cycles will be added internally in order to compensate tDQSCK delay. 0x0 no additional latency. 0x1 1 cycle additional latency. 0x2 2 cycles additional latency. 0x3 3 cycles additional latency. 0x4 4 cycles additional latency. 0x5 5 cycles additional latency. 0x6 6 cycles additional latency. 0x7 7 cycles additional latency.
5 DDR_4_BANK	Number of banks per DDR device. When this bit is set to "1" then the MMDC will work with DDR device of 4 banks. 0 8 banks device is being used. (Default) 1 4 banks device is being used
4–3 DDR_TYPE	DDR TYPE. This field determines the type of the external DDR device. 0x0 DDR3 device is used. 0x1 LPDDR2 device is used. 0x2 Reserved 0x3 Reserved
2 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MDMISC field descriptions (continued)

Field	Description
1 RST	Software Reset. When this bit is asserted then the internal FSMs and registers of the MMDC will be initialized. NOTE: This bit once asserted gets deasserted automatically. 0 Do nothing. 1 Assert reset to the MMDC.
0 Reserved	This read-only field is reserved and always has the value 0.

36.12.8 MMDC Core Special Command Register (MMDC_MDSCR)

This register is used to issue special commands manually toward the external DDR device (such as load mode register, manual self refresh, manual precharge and so on). Every write to this register will be interpreted as a command, and a read from this register will show the last command that was executed.

Every write to this register will result in one special command, and the IP bus will assert `ips_xfr_wait` as long as the special command is being carried out.

Address: 21B_0000h base + 1Ch offset = 21B_001Ch

MMDC_MDSCR field descriptions

Field	Description
31–24 CMD_ADDR_ MSB_MR_OP	Command/Address MSB. This field indicates the MSB of the command/Address. In LPDDR2/LPDDR3 this field indicates the MRW operand
23–16 CMD_ADDR_ LSB_MR_ADDR	Command/Address LSB. This field indicates the LSB of the command/Address In LPDDR2/LPDDR3 this field indicates the MRR/MRW address
15 CON_REQ	Configuration request. When this bit is set then the MMDC will clean the pending AXI accesses and will prevent from further AXI accesses to be acknowledged. This field guarantee safe configuration (or change configuration) of the MMDC while no access is in process and prevents an unexpected behaviour. After setting this bit, it is needed to poll on CON_ACK until it is set to "1". When CON_ACK is asserted then configuration is permitted. After configuration is completed then this bit must be deasserted in order to process further AXI accesses. NOTE: This bit is asserted at the end of the reset sequence, meaning that the MMDC is waiting to configure and initialize the external memory before accepting any AXI accesses. Configuration request/acknowledge mechanism should be used for the following procedures: changing of timing parameters , during calibration process or driving commands via MDSCR[CMD]

Table continues on the next page...

MMDC_MDSCR field descriptions (continued)

Field	Description
	0 No request to configure MMDC. 1 A request to configure MMDC is valid
14 CON_ACK	Configuration acknowledge. Whenever this bit is set, it is permitted to configure MMDC IP registers. 0 Configuration of MMDC registers is forbidden. 1 Configuration of MMDC registers is permitted.
13–11 Reserved	This read-only field is reserved and always has the value 0.
10 MRR_READ_DATA_VALID	MRR read data valid. This field indicates that read data is valid at MDMRR register NOTE: This field is relevant only for LPDDR2/LPDDR3 mode 0 Cleared upon the assertion of MRR command 1 Set after MRR data is valid and stored at MDMRR register.
9 WL_EN	DQS pads direction. This bit controls the DQS pads direction during write-leveling calibration process. Before starting the write-leveling calibration process this bit should be set to "1". It should be set to "0" when sending write leveling exit command. For further information see Write leveling Calibration . 0 Exit write leveling mode or stay in normal mode. 1 Write leveling entry command was sent.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–4 CMD	Command. This field contains the command to be executed. This field will be automatically cleared after the command will be send to the DDR memory. NOTE: Only the 0x5 Precharge all command should be used, memory operation is unpredictable when using the 0x1 command 0x0 Normal operation 0x1 Reserved 0x2 Auto-Refresh Command (set correct CMD_CS). 0x3 Load Mode Register Command DDR2/DDR3, set correct CMD_CS, CMD_BA, CMD_ADDR_LSB, CMD_ADDR_MSB), MRW Command (LPDDR2/LPDDR3, set correct CMD_CS, MR_OP, MR_ADDR) 0x4 ZQ calibration (DDR2/DDR3, set correct CMD_CS, {CMD_ADDR_MSB,CMD_ADDR_LSB} = 0x400 or 0x0) 0x5 Precharge all, only if banks open (set correct CMD_CS). 0x6 MRR command (LPDDR2/LPDDR3, set correct CMD_CS, MR_ADDR) 0x7 Reserved
3 CMD_CS	Chip Select. This field determines which chip select the command is targeted to 0 to Chip-select 0 1 to Chip-select 1
CMD_BA	Bank Address. This field determines the address of the bank within the selected chip-select where the command is targeted to. 0x0 bank address 0

0x2	bank address 2
0x7	bank address 7

36.12.9 MMDC Core Refresh Control Register (MMDC_MDREF)

This register determines the refresh scheme that will be executed toward the DDR device. It specifies how often a refresh cycle occurs and how many refresh commands will be executed every refresh cycle.

For further information see [Refresh Scheme](#) .

The following tables show examples of possible refresh schemes.

Table 36-15. Refresh rate example for REF_SEL = 0

REFR[2:0]	Number of refresh commands every 64KHz	Average periodic refresh rate (tREFI)	System Refresh period
0x0	1	15.6 μ s	tRFC
0x1	2	7.8 μ s	2*tRFC
0x3	4	3.9 μ s	4*tRFC
0x7	8	1.95 μ s	8*tRFC

Table 36-16. Refresh rate example for REF_SEL = 1

REFR[2:0]	Number of refresh commands every 32KHz	Average periodic refresh rate (tREFI)	System Refresh period
0x1	2	15.6 μ s	2*tRFC
0x3	4	7.8 μ s	4*tRFC
0x7	8	3.9 μ s	8*tRFC

Table 36-17. Refresh rate example for REF_SEL = 2@ 400MHz

REFR[2:0]	Number of refresh commands every refresh cycle	REF_CNT	Average periodic refresh rate (tREFI)	System Refresh period
0x0	1	0x618	3.9 μ s	tRFC
0x1	2	0xC30	3.9 μ s	2*tRFC

Table continues on the next page...

Table 36-17. Refresh rate example for REF_SEL = 2@ 400MHz (continued)

REFR[2:0]	Number of refresh commands every refresh cycle	REF_CNT	Average periodic refresh rate (tREFI)	System Refresh period
0x2	3	0x1248	3.9µs	3*tRFC
0x3	4	0x1860	3.9 µs	4*tRFC

Other refresh configurations are also allowed; the configuration values in the tables above are only examples for obtaining the desired average periodic refresh rate.

If the required average periodic refresh rate (tREFI) is kept, all of the rows will be refreshed in every refresh window. Because the memory device issues additional refresh commands for every refresh it receives, the tREFI remains the same across the device, regardless of its number of rows. This is particularly relevant in the tRFC parameter, which becomes bigger as the density increases.

Address: 21B_0000h base + 20h offset = 21B_0020h

MMDC_MDREF field descriptions

Field	Description
31–16 REF_CNT	Refresh Counter at DDR clock period If REF_SEL equals '2' a refresh cycle will begin every amount of DDR cycles configured in this field. 0x0 Reserved. 0x1 1 cycle. 0xFFFFE 65534 cycles. 0xFFFFF 65535 cycles.
15–14 REF_SEL	Refresh Selector. This bit selects the source of the clock that will trigger each refresh cycle:

Table continues on the next page...

MMDC_MDREF field descriptions (continued)

Field	Description
	0 Periodic refresh cycles will be triggered in frequency of 64KHz. 1 Periodic refresh cycles will be triggered in frequency of 32KHz. 2 Periodic refresh cycles will be triggered every amount of cycles that are configured in REF_CNT field. 3 No refresh cycles will be triggered.
13–11 REFR	Refresh Rate. This field determines how many refresh commands will be issued every refresh cycle. After every refresh command the MMDC won't drive any command to the DDR device until satisfying tRFC period 0x0 1 refresh 0x1 2 refreshes 0x2 3 refreshes 0x3 4 refreshes 0x4 5 refreshes 0x5 6 refreshes 0x6 7 refreshes 0x7 8 refreshes
10–1 Reserved	This read-only field is reserved and always has the value 0.
0 START_REF	Manual start of refresh cycle. When this field is set to '1' the MMDC will start a refresh cycle immediately according to number of refresh commands that are configured in 'REFR' field. This bit returns to zero automatically. 0 Do nothing. 1 Start a refresh cycle.

36.12.10 MMDC Core Read/Write Command Delay Register (MMDC_MDRWD)

This register determines the delay between back to back read and write accesses. The register reset values are set to the minimum required value. As the default values are set to achieve optimal results, changing them is discouraged.

Address: 21B_0000h base + 2Ch offset = 21B_002Ch

15–12 Reserved	This read-only field is reserved and always has the value 0.
11–8 tRCD_LP	Active command to internal read or write delay time (same bank). This field is valid only for LPDDR2 memories 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF Reserved
7–4 tRPpb_LP	Precharge (per bank) command period (same bank). This field is valid only for LPDDR2 memories 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF Reserved
tRPab_LP	Precharge (all banks) command period. This field is valid only for LPDDR2 memories 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF Reserved

36.12.14 MMDC Core MR4 Derating Register (MMDC_MDMR4)

This register is relevant only for LPDDR2 mode. It is used to dynamically change certain values depending on MR4 read result, which is based on memory temperature sensor result.

Address: 21B_0000h base + 3Ch offset = 21B_003Ch

MMDC_MDMR4 field descriptions

Field	Description
31–9 Reserved	This read-only field is reserved and always has the value 0.
8 tRRD_DE	tRRD derating value. 0 Original tRRD is used. 1 tRRD is derated in 1 cycle.
7 tRP_DE	tRP derating value. 0 Original tRP is used. 1 tRP is derated in 1 cycle.
6 tRAS_DE	tRAS derating value. 0 Original tRAS is used. 1 tRAS is derated in 1 cycle.
5 tRC_DE	tRC derating value. 0 Original tRC is used. 1 tRC is derated in 1 cycle.
4 tRCD_DE	tRCD derating value. 0 Original tRCD is used. 1 tRCD is derated in 1 cycle.
3–2 Reserved	This read-only field is reserved and always has the value 0.
1 UPDATE_DE_ACK	Update Derated Values Acknowledge. This read only bit will be cleared upon UPDATE_DE_REQ assertion and will be set after the new values are taken.
0 UPDATE_DE_REQ	Update Derated Values Request. This read modify write field is automatically cleared after the request is issued. 0 Do nothing. 1 Request to update the following values: tRRD, tRCD, tRP, tRC, tRAS and refresh related fields(MDREF register): REF_CNT, REF_SEL, REFR

36.12.15 MMDC Core Address Space Partition Register (MMDC_MDASP)

This register defines the partitioning between chip select 0 and chip select 1. For further information see [Chip select settings](#).

Address: 21B_0000h base + 40h offset = 21B_0040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MMDC_MDASP field descriptions

Field	Description
31–7 Reserved	This read-only field is reserved and always has the value 0.
CS0_END	CS0_END. Defines the absolute last address associated with CS0 with increments of 256Mb. CS0_END=AXI_ADDRESS[31:25] bits. MMDC0_MDASP[CS0_END] should be set to DDR_CS_SIZE/32M + 0x3f (channel 0 base address begins at 0x80000000)

36.12.16 MMDC Core AXI Reordering Control Register (MMDC_MAARCR)

This register determines the values of the weights used for the re-ordering arbitration engine. For further information see [Performance](#) .

Address: 21B_0000h base + 400h offset = 21B_0400h

MMDC_MAARCR field descriptions

Field	Description
31 ARCR_SEC_ERR_LOCK	Once set, this bit locks ARCR_SEC_ERR_EN and prevents from its updating. This bit can be only cleared by reset Default value is 0x0 - encoding 0 (unlocked) 0 ARCR_SEC_ERR_EN is unlocked, so can be updated any moment 1 ARCR_SEC_ERR_EN is locked, so it can't be updated
30 ARCR_SEC_ERR_EN	This bit defines whether security read/write access violation result in SLV Error response or in OKAY response Default value is 0x1 - encoding 1(response is SLV Error, rresp/bresp=2'b10) 0 security violation results in OKAY response (rresp/bresp=2'b00) 1 security violation results in SLAVE Error response (rresp/bresp=2'b10)

Table continues on the next page...

MMDC_MAARCR field descriptions (continued)

Field	Description
29 -	This field is reserved. Reserved
28 ARCR_EXC_ERR_EN	This bit defines whether exclusive read/write access violation of AXI 6.2.4 rule result in SLV Error response or in OKAY response Default value is 0x1 - encoding 1(response is SLV Error) 0 violation of AXI exclusive rules (6.2.4) result in OKAY response (rresp/bresp=2'b00) 1 violation of AXI exclusive rules (6.2.4) result in SLAVE Error response (rresp/bresp=2'b10)
27 -	This field is reserved. Reserved
26 ARCR_ARB_REO_DIS	0 MMDC arbitration and reordering controls enabled 1 MMDC arbitration and reordering controls disabled
25 ARCR_REO_DIS	0 MMDC reordering controls only enabled 1 MMDC reordering controls only disabled
24 ARCR_RCH_EN	This bit defines whether Real time channel is activated and bypassed all other pending accesses, So accesses with QoS=='F' will be granted the highest priority in the optimization/reordering mechanism Default value is 0x1 - encoding 1 (Enabled) 0 normal prioritization, no bypassing 1 accesses with QoS=='F' bypass the arbitration
23 -	This field is reserved. Reserved
22–20 ARCR_PAG_HIT	ARCR Page Hit Rate. This value will be added by the optimization/reordering mechanism to any pending access that is targeted to an open DDR row. Default value of ARCR_PAG_HIT is 0x00100 - encoding 4.
19 -	This field is reserved. Reserved
18–16 ARCR_ACC_HIT	ARCR Access Hit Rate. This value will be added by the optimization/reordering mechanism to any pending access that has the same access type (read/write) as the previous access. Default value of is ARCR_ACC_HIT 0x0010 - encoding 2.
15–12 -	This field is reserved. Reserved
11–8 ARCR_DYN_JMP	ARCR Dynamic Jump. Each time an access wan't chosen by the optimization/reordering mechanism then its dynamic score will be incremented by ARCR_DYN_JMP value. NOTE: Setting ARCR_DYN_JMP may cause starvation of low priority accesses NOTE: ARCR_DYN_JMP must be smaller than ARCR_DYN_MAX Default ARCR_DYN_JMP value is 0x0001 - encoding 1
7–4 ARCR_DYN_MAX	ARCR Dynamic Maximum. ARCR_DYN_MAX is the maximum dynamic score value that each access inside the optimization/reordering mechanism can get. 0000 0 0001 1 1111 15 (default)

Table continues on the next page...

MMDC_MAARCR field descriptions (continued)

Field	Description
ARCR_GUARD	ARCR Guard. After an access reached the maximum dynamic score value, it will wait additional ARCR_GUARD arbitration cycles and then will gain the highest priority in the optimization/reordering mechanism. 0000 15 (default) 0001 16 1111 30

36.12.17 MMDC Core Power Saving Control and Status Register (MMDC_MAPSR)

The MAPSR determines the power saving features of MMDC. For further information see [Power Saving and Clock Frequency Change modes](#).

Address: 21B_0000h base + 404h offset = 21B_0404h

MMDC Memory Map/Register Definition

MMDC_MAPSR field descriptions

Field	Description
31–26 -	This field is reserved. Reserved
25 DVACK	General DVFS acknowledge. This read only bit indicates whether a dvfs acknowledge was asserted and that MMDC is in self-refresh mode
24 LPACK	General low-power acknowledge. This read only bit indicates whether a low-power acknowledge was asserted and that MMDC is in self-refresh mode
23–22 -	This field is reserved. Reserved
21 DVFS	General DVFS request. SW request for DVFS. Assertion of this bit will yield in self-refresh entry sequence 0 no dvfs request 1 dvfs request
20 LPMD	General LPMD request. SW request for LPMD. Assertion of this bit will yield in self-refresh entry sequence 0 no lpmd request 1 lpmd request
19–16 -	This field is reserved. Reserved
15–8 PST	Automatic Power saving timer. Valid only when PSD is set to "0". When the MMDC is idle for amount of cycles specified in that field then the DDR device will be entered automatically into self-refresh mode. The real value which is used is register-value multiplied by 64. 00000000 Reserved - this value is forbidden. 00000001 timer is configured to 64 clock cycles. 00000010 timer is configured to 128 clock cycles.

Table continues on the next page...

MMDC_MAPSR field descriptions (continued)

Field	Description
	00010000 (Default)- 1024 clock cycles. 11111111 timer clock is configured to 16320 clock cycles.
7 -	This field is reserved. Reserved.
6 WIS	Write Idle Status. This read only bit indicates whether write request buffer is idle (empty) or not. 0 idle 1 not idle
5 RIS	Read Idle Status. This read only bit indicates whether read request buffer is idle (empty) or not. 0 idle 1 not idle
4 PSS	Power Saving Status. This read only bit indicates whether the MMDC is in automatic power saving mode. 0 not in power saving 1 power saving
3-1 -	This field is reserved. Reserved.
0 PSD	Automatic Power Saving Disable. When the value of PSD is "0" (i.e automatic power saving is enabled) then the PST is activated and MMDC will enter automatically to self-refresh while the number of idle cycle reached. NOTE: This bit must be disabled (i.e set to "1") during calibration process 0 power saving enabled 1 power saving disabled (default)

36.12.18 MMDC Core Exclusive ID Monitor Register0 (MMDC_MAEXIDR0)

This register defines the ID to be monitored for exclusive accesses of monitor0 and monitor1. For further information see [Exclusive accesses handling](#) .

Address: 21B_0000h base + 408h offset = 21B_0408h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MMDC_MAEXIDR1 field descriptions

Field	Description
31–16 EXC_ID_MONITOR3	This field defines ID for Exclusive monitor#3. Default value is 0x0060
EXC_ID_MONITOR2	This field defines ID for Exclusive monitor#2. Default value is 0x0040

36.12.20 MMDC Core Debug and Profiling Control Register 0 (MMDC_MADPCR0)

Address: 21B_0000h base + 410h offset = 21B_0410h

MMDC_MADPCR0 field descriptions

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
9 SBS	Step By Step trigger. If SBS_EN is set to "1" then dispatching AXI pending access toward the DDR will done only if this bit is set to "1", otherwise no access will be dispatched toward the DDR. This bit is cleared when the pending access has been issued toward the DDR. 1 Launch AXI pending access toward the DDR 0 No access will be launched toward the DDR
8 SBS_EN	Step By Step debug Enable. Enable step by step mode. Every time this mechanism is enabled then setting SBS to "1" will dispatch one pending AXI access to the DDR and in parallel its attributes will be observed in the status registres (MASBS0 and MASBS1). For further information see Step By Step (SBS) software monitor . 0 disable 1 enable
7–4 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MADPCR0 field descriptions (continued)

Field	Description
3 CYC_OVF	Total Profiling Cycles Count Overflow. When profiling mechanism is enabled (DBG_EN is set to "1") then this bit is asserted when overflow of CYC_COUNT occurred. Cleared by writing 1 to it. 0 no overflow 1 overflow
2 PRF_FRZ	Profiling freeze. When this bit is asserted then the profiling mechanism will be froze and the associated status registers (MADPSR0-MADPSR5) will hold the the current profiling values. 0 profiling counters are not frozen 1 profiling counters are frozen
1 DBG_RST	Debug and Profiling Reset. Reset all debug and profiling counters and components. 0 no reset 1 reset
0 DBG_EN	Debug and Profiling Enable. Enable debug and profiling mechanism. When this bit is asserted then the MMDC will perform a profiling based on the ID that is configured to MADPCR1. Upon assertion of PRF_FRZ the profiling will be froze and the profiling results will be sampled to the status registers (MADPSR0-MADPSR5). For further information see MMDC Profiling . default is "disable" 0 disable 1 enable

36.12.21 MMDC Core Debug and Profiling Control Register 1 (MMDC_MADPCR1)

Address: 21B_0000h base + 414h offset = 21B_0414h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDC_MADPCR1 field descriptions

Field	Description
31-16 PRF_AXI_ID_MASK	Profiling AXI ID Mask. AXI ID bits which masked by this value are chosen for profiling. 1 AXI ID specific bit is chosen for profiling 0 AXI ID specific bit is ignored (don't care)
PRF_AXI_ID	Profiling AXI ID. AXI IDs that matches a bit-wise AND logic operation between PRF_AXI_ID and PRF_AXI_ID_MASK are chosen for profiling. Default value is 0x0, to choose any ID-s for profiling

36.12.22 MMDC Core Debug and Profiling Status Register 0 (MMDC_MADPSR0)

Address: 21B_0000h base + 418h offset = 21B_0418h

MMDC_MADPSR0 field descriptions

Field	Description
CYC_COUNT	Total Profiling cycle Count. This field reflects the total cycle count in case the profiling mechanism is enabled from assertion of DBG_EN and until PRF_FRZ is asserted

36.12.23 MMDC Core Debug and Profiling Status Register 1 (MMDC_MADPSR1)

The register reflects the total cycles during which the MMDC state machines were busy (both writes and reads). This information can be used for DDR Utilization calculation.

Address: 21B_0000h base + 41Ch offset = 21B_041Ch

MMDC_MADPSR1 field descriptions

Field	Description
BUSY_COUNT	Profiling Busy Cycles Count. This field reflects the total number of cycles where the MMDC read and write state machines were busy during the profiling period. Can be used for DDR utilization calculations. Busy cycles are any MMDC clock cycles where the internal state machine is not idle. If any read or write requests are pending in the FIFOs, the MMDC is not idle.

36.12.24 MMDC Core Debug and Profiling Status Register 2 (MMDC_MADPSR2)

This register reflects the total number of read accesses (per AXI ID) toward MMDC.

Address: 21B_0000h base + 420h offset = 21B_0420h

MMDC_MADPSR2 field descriptions

Field	Description
RD_ACC_COUNT	Profiling Read Access Count. This register reflects the total number of read accesses (per AXI ID) toward MMDC.

36.12.25 MMDC Core Debug and Profiling Status Register 3 (MMDC_MADPSR3)

This register reflects the total number of write accesses (per AXI ID) toward MMDC.

Address: 21B_0000h base + 424h offset = 21B_0424h

MMDC_MADPSR3 field descriptions

Field	Description
WR_ACC_COUNT	Profiling Write Access Count. This register reflects the total number of write accesses (per AXI ID) toward MMDC.

36.12.26 MMDC Core Debug and Profiling Status Register 4 (MMDC_MADPSR4)

This register reflects the total number of bytes that were transferred during read access (per AXI ID) toward MMDC.

Address: 21B_0000h base + 428h offset = 21B_0428h

MMDC_MADPSR4 field descriptions

Field	Description
RD_BYTES_COUNT	Profiling Read Bytes Count. This register reflects the total number of bytes that were transferred during read access (per AXI ID) toward MMDC.

36.12.27 MMDC Core Debug and Profiling Status Register 5 (MMDC_MADPSR5)

This register reflects the total number of bytes that were transferred during write access (per AXI ID) toward MMDC.

Address: 21B_0000h base + 42Ch offset = 21B_042Ch

MMDC_MADPSR5 field descriptions

Field	Description
WR_BYTES_COUNT	Profiling Write Bytes Count. This register reflects the total number of bytes that were transferred during write access (per AXI ID) toward MMDC.

36.12.28 MMDC Core Step By Step Address Register (MMDC_MASBS0)

Address: 21B_0000h base + 430h offset = 21B_0430h

MMDC_MASBS0 field descriptions

Field	Description
SBS_ADDR	Step By Step Address. These bits reflect the address of the pending request in case of step by step mode.

36.12.29 MMDC Core Step By Step Address Attributes Register (MMDC_MASBS1)

Address: 21B_0000h base + 434h offset = 21B_0434h

MMDC_MASBS1 field descriptions

Field	Description
31–16 SBS_AXI_ID	Step By Step AXI ID. These bits reflect the AXI ID of the pending request in case of step by step mode.
15–13 SBS_LEN	Step By Step Length. These bits reflect the AXI LENGTH of the pending request in case of step by step mode. 000 burst of length 1 001 burst of length 2 111 burst of length 8
12 SBS_BUFF	Step By Step Buffered. This bit reflect the AXI CACHE[0] of the pending request in case of step by step mode. Relevant only for write requests

Table continues on the next page...

MMDC_MASBS1 field descriptions (continued)

Field	Description
11–10 SBS_BURST	Step By Step Burst. These bits reflect the AXI BURST of the pending request in case of step by step mode. 00 FIXED 01 INCR burst 10 WRAP burst 11 reserved
9–7 SBS_SIZE	Step By Step Size. These bits reflect the AXI SIZE of the pending request in case of step by step mode. 000 8 bits 001 16 bits 010 32 bits 011 64 bits 100 128bits 101-111 Reserved
6–4 SBS_PROT	Step By Step Protection. These bits reflect the AXI PROT of the pending request in case of step by step mode.
3–2 SBS_LOCK	Step By Step Lock. These bits reflect the AXI LOCK of the pending request in case of step by step mode.
1 SBS_TYPE	Step By Step Request Type. These bits reflect the type (read/write) of the pending request in case of step by step mode. 0 write 1 read
0 SBS_VLD	Step By Step Valid. This bit reflects whether there is a pending request in case of step by step mode. 0 not valid 1 valid

36.12.30 MMDC Core General Purpose Register (MMDC_MAGENP)

This register is a general 32 bit read/write register.

Address: 21B_0000h base + 440h offset = 21B_0440h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MMDC_MPZQHWCTRL field descriptions

Field	Description
31–27 ZQ_EARLY_COMPARATOR_EN_TIMER	ZQ early comparator enable timer. This timer defines the interval between the warming up of the comparator of the i.MX ZQ calibration pad and the beginning of the ZQ calibration process with the pad 0x0 - 0x6 Reserved 0x7 8 cycles 0x14 21 cycles (Default) 0x1E 31 cycles 0x1F 32 cycles
26 Reserved	This read-only field is reserved and always has the value 0.
25–23 TZQ_CS	Device ZQ short time. This field holds the number of cycles that are required by the external DDR device to perform ZQ short calibration. Upon driving the command to the DDR device then no further accesses will be issued to the DDR device till satisfying that time. NOTE: In LPDDR2 the ZQ short time is taken from MPZQLP2CTL[ZQ_LP2_HW_ZQCS] NOTE: This field should not be update during ZQ calibration. 000 Reserved 001 Reserved 010 128 cycles (Default) 011 256 cycles 100 512 cycles 101 1024 cycles 110- 111 Reserved
22–20 TZQ_OPER	Device ZQ long/oper time. This field holds the number of cycles that are required by the external DDR device to perform ZQ long calibration except the first ZQ long command that is issued after reset. Upon driving the command to the DDR device then no further accesses will be issued to the DDR device till satisfying that time. NOTE: In LPDDR2/3 the ZQ oper time is taken from MPZQLP2CTL[ZQ_LP2_HW_ZQCL]

Table continues on the next page...

MMDC_MPZQHWCTRL field descriptions (continued)

Field	Description
	<p>NOTE: This field should not be update during ZQ calibration.</p> <p>000 Reserved 001 Reserved 010 128 cycles 011 256 cycles - Default (JEDEC value for DDR3) 100 512 cycles 101 1024 cycles 110- 111 Reserved</p>
19–17 TZQ_INIT	<p>Device ZQ long/init time. This field holds the number of cycles that are required by the external DDR device to perform ZQ long calibration right after reset. Upon driving the command to the DDR device then no further accesses will be issued to the DDR device till satisfying that time.</p> <p>NOTE: In LPDDR2 the ZQ init time is taken from MPZQLP2CTL[ZQ_LP2_HW_ZQINIT]</p> <p>NOTE: This field should not be update during ZQ calibration.</p> <p>000 Reserved 001 Reserved 010 128 cycles 011 256 cycles 100 512 cycles - Default (JEDEC value for DDR3) 101 1024 cycles 110- 111 Reserved</p>
16 ZQ_HW_FOR	<p>Force ZQ automatic calibration process with the i.MX ZQ calibration pad. When this bit is asserted then the MMDC will issue one ZQ automatic calibration process with the i.MX ZQ calibration pad. It is the user responsibility to make sure that all the accesses to DDR will be finished before asserting this bit using CON_REQ/CON_ACK mechanism. HW will negate this bit upon completion of the ZQ calibration process. Upon negation of this bit the ZQ HW calibration pull-up and pull-down results (ZQ_HW_PU_RES and ZQ_HW_PD_RES respectively) are valid</p> <p>NOTE: In order to enable this bit ZQ_MODE must be set to either "1" or "3"</p>
15–11 ZQ_HW_PD_RES	<p>ZQ HW calibration pull-down result. This field holds the pull-down resistor value calculated at the end of the ZQ automatic calibration process with the i.MX ZQ calibration pad.</p> <p>NOTE: An offset can be applied to this result, see MMDC_MPPDCMPR2[ZQ_PD_OFFSET].</p> <p>00000 Max. resistance. 11111 Min. resistance.</p>
10–6 ZQ_HW_PU_RES	<p>ZQ automatic calibration pull-up result. This field holds the pull-up resistor value calculated at the end of the ZQ automatic calibration process with the i.MX ZQ calibration pad.</p> <p>NOTE: An offset can be applied to this result, see MMDC_MPPDCMPR2[ZQ_PU_OFFSET]</p> <p>00000 Min. resistance. 11111 Max. resistance.</p>
5–2 ZQ_HW_PER	<p>ZQ periodic calibration time. This field determines how often the periodic ZQ calibration is performed. This field is applied for both ZQ short calibration and ZQ automatic calibration process with i.MX ZQ calibration pad. Whenever this timer is expired then according to ZQ_MODE the ZQ automatic calibration process with the i.MX ZQ calibration pad will be issued and/or short/long command will be issued to the external DDR device.</p>

Table continues on the next page...

MMDC_MPZQHWCTRL field descriptions (continued)

Field	Description
	<p>This field is ignored if ZQ_MODE equals "00"</p> <p>0000 ZQ calibration is performed every 1 ms. 0001 ZQ calibration is performed every 2 ms. 0010 ZQ calibration is performed every 4 ms. 1010 ZQ calibration is performed every 1 sec. 1110 ZQ calibration is performed every 16 sec. 1111 ZQ calibration is performed every 32 sec.</p>
ZQ_MODE	<p>ZQ calibration mode:</p> <p>0x0 No ZQ calibration is issued. (Default) 0x1 ZQ calibration is issued to i.MX ZQ calibration pad together with ZQ long command to the external DDR device only when exiting self refresh. 0x2 ZQ calibration command long/short is issued only to the external DDR device periodically and when exiting self refresh 0x3 ZQ calibration is issued to i.MX ZQ calibration pad together with ZQ calibration command long/short to the external DDR device periodically and when exiting self refresh</p>

36.12.32 MMDC PHY ZQ SW control register (MMDC_MPZQSWCTRL)

Address: 21B_0000h base + 804h offset = 21B_0804h

MMDC_MPZQSWCTRL field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17–16 ZQ_CMP_OUT_SMP	Defines the amount of cycles between driving the ZQ signals to the ZQ pad and till sampling the comparator enable output while performing ZQ calibration process with the i.MX ZQ calibration pad 00 7 cycles 01 15 cycles

Table continues on the next page...

MMDC_MPZQSWCTRL field descriptions (continued)

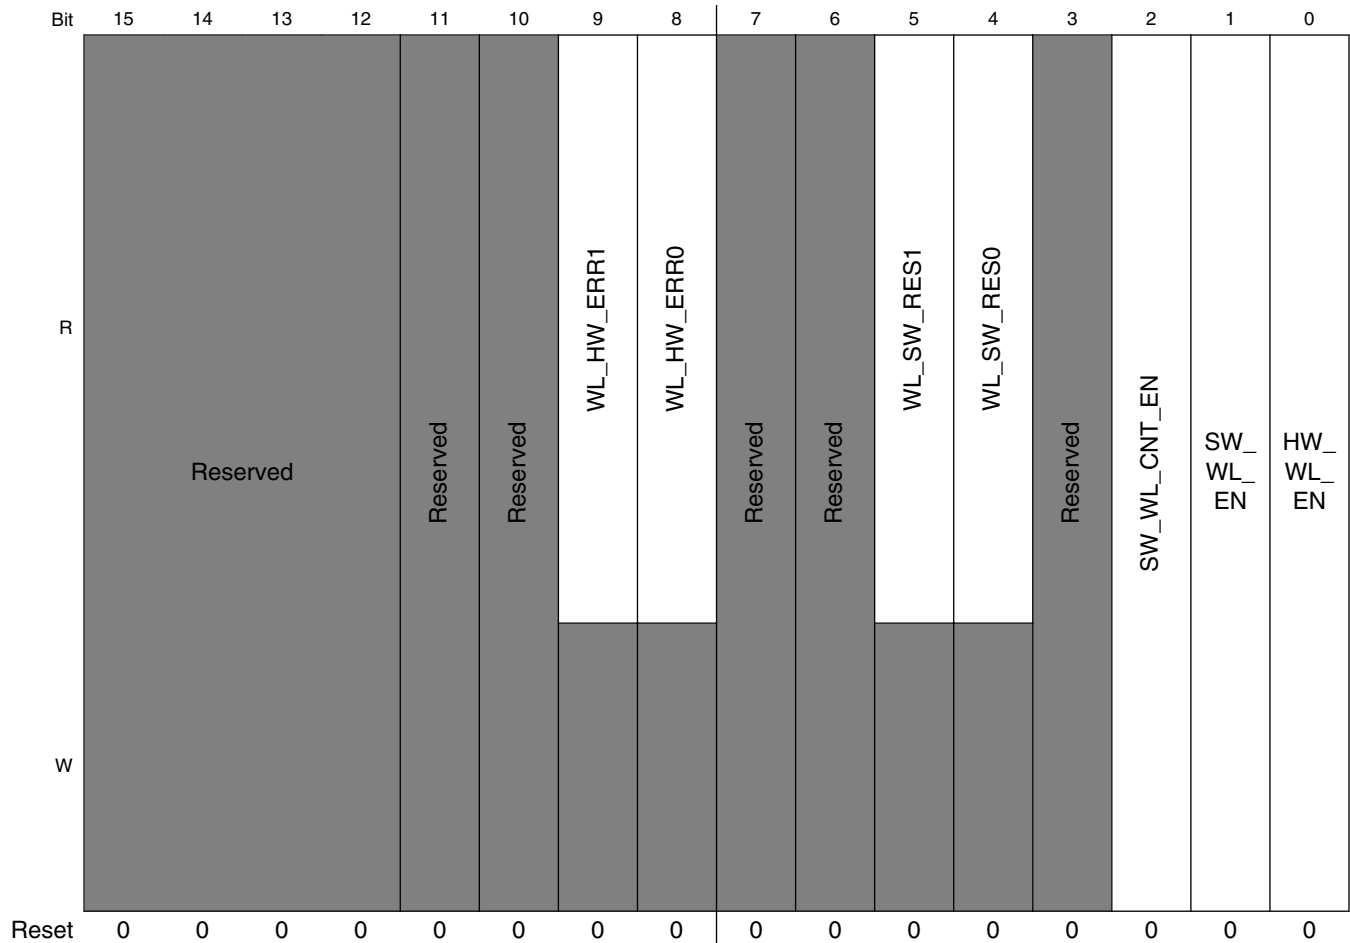

Field	Description
	10 23 cycles 11 31 cycles
15–14 Reserved	This read-only field is reserved and always has the value 0.
13 USE_ZQ_SW_VAL	Use SW ZQ configured value for I/O pads resistor controls. This bit selects whether ZQ SW value or ZQ HW value will be driven to the I/O pads resistor controls. By default this bit is cleared and MMDC drives the HW ZQ status bits on the resistor controls of the I/O pads. NOTE: This bit should not be updated during ZQ calibration. 0 Fields ZQ_HW_PD_VAL & ZQ_HW_PU_VAL will be driven to I/O pads resistor controls. 1 Fields ZQ_SW_PD_VAL & ZQ_SW_PU_VAL will be driven to I/O pads resistor controls.
12 ZQ_SW_PD	ZQ software PU/PD calibration. This bit determines the calibration stage (PU or PD). 0 PU resistor calibration 1 PD resistor calibration
11–7 ZQ_SW_PD_VAL	ZQ software pull-down resistance. This field determines the value of the PD resistor during SW ZQ calibration. 00000 Max. resistance. 11111 Min. resistance.
6–2 ZQ_SW_PU_VAL	ZQ software pull-up resistance. This field determines the value of the PU resistor during SW ZQ calibration. 00000 Min. resistance. 11111 Max. resistance.
1 ZQ_SW_RES	ZQ software calibration result. This bit reflects the ZQ calibration voltage comparator value. 0 Current ZQ calibration voltage is less than VDD/2. 1 Current ZQ calibration voltage is more than VDD/2
0 ZQ_SW_FOR	ZQ SW calibration enable. This bit when asserted enables ZQ SW calibration. HW negates this bit upon completion of the ZQ SW calibration. Upon negation of this bit the ZQ SW calibration result (i.e ZQ_SW_RES) is valid

36.12.33 MMDC PHY Write Leveling Configuration and Error Status Register (MMDC_MPWLGCR)

Address: 21B_0000h base + 808h offset = 21B_0808h

MMDC Memory Map/Register Definition

MMDC_MPWLGCR field descriptions

Field	Description
31–12 -	This field is reserved. Reserved
11 -	This field is reserved. Reserved
10 -	This field is reserved. Reserved
9 WL_HW_ERR1	Byte1 write-leveling HW calibration error. This bit is asserted when an error was found on byte1 during write-leveling HW calibration. This bit is valid only upon completion of the write-leveling HW calibration (i.e. HW_WL_EN bit is de-asserted) 0 No error was found on byte1 during write-leveling HW calibration. 1 An error was found on byte1 during write-leveling HW calibration.
8 WL_HW_ERR0	Byte0 write-leveling HW calibration error. This bit is asserted when an error was found on byte0 during write-leveling HW calibration. This bit is valid only upon completion of the write-leveling HW calibration (i.e. HW_WL_EN bit is de-asserted)

Table continues on the next page...

MMDC_MPWLGCR field descriptions (continued)

Field	Description
	0 No error was found on byte0 during write-leveling HW calibration. 1 An error was found on byte0 during write-leveling HW calibration.
7 -	This field is reserved. Reserved
6 -	This field is reserved. Reserved
5 WL_SW_RES1	Byte1 write-leveling software result. This bit reflects the value that is driven by the DDR device on DQ8 during SW write-leveling. 0 DQS1 sampled low CK during SW write-leveling. 1 DQS1 sampled high CK during SW write-leveling.
4 WL_SW_RES0	Byte0 write-leveling software result. This bit reflects the value that is driven by the DDR device on DQ0 during SW write-leveling. 0 DQS0 sampled low CK during SW write-leveling. 1 DQS0 sampled high CK during SW write-leveling.
3 -	This field is reserved. Reserved
2 SW_WL_CNT_EN	SW write-leveling count down enable. This bit when asserted set a certain delay of (25+15) cycles from the setting of SW_WL_EN and before driving the DQS to the DDR device. This bit should be asserted before the first SW write-leveling request and after issuing the write leveling MRS command 0 MMDC doesn't count 25+15 cycles before issuing write-leveling DQS. 1 MMDC counts 25+15 cycles before issuing write-leveling DQS.
1 SW_WL_EN	Write-Leveling SW enable. If this bit is asserted then the MMDC will perform one write-leveling iteration with the DDR device (assuming that Write-Leveling procedure is already enabled in the DDR device through MRS command). HW negate this bit upon completion of the SW write-leveling. Negation of this bit also points that the write-leveling SW calibration result is valid NOTE: If this bit and the SW_WL_CNT_EN are enabled the MMDC counts 25 + 15 cycles before issuing the SW write-leveling DQS.
0 HW_WL_EN	Write-Leveling HW (automatic) enable. If this bit is asserted then the MMDC will perform the whole Write-Leveling sequence with the DDR device (assuming that Write-Leveling procedure is already enabled in the DDR device through MRS command). HW negates this bit upon completion of the HW write-leveling. Negation of this bit also points that the write-leveling HW calibration results are valid NOTE: Before issuing the first DQS the MMDC counts 25 + 15 cycles automatically as required by the standard.

36.12.34 MMDC PHY Write Leveling Delay Control Register 0 (MMDC_MPWLDECTRL0)

Address: 21B_0000h base + 80Ch offset = 21B_080Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDC_MPWLDECTRL0 field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26–25 WL_CYC_DEL1	<p>Write leveling cycle delay for Byte 1. This field indicates whether a delay of 1 or 2 cycles between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_HC_DEL. So the total delay is the sum of (WL_DL_ABS_OFFSET/256*cycle) + (WL_HC_DEL*half cycle) + (WL_CYC_DEL*cycle).</p> <p>When both SW write-leveling is enabled (i.e. SW_WL_EN = 1) or HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_HC_DEL.</p> <p>Note that in HW write-leveling this field is not used for indication, as in WL_DL_OFFSET and WL_HC_DEL, but for configuration.</p> <p>0 No delay is added. 1 1 cycle delay is added. 2 2 cycles delay is added. 3 Reserved.</p>
24 WL_HC_DEL1	<p>Write leveling half cycle delay for Byte 1. This field indicates whether a delay of half cycle between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_CYC_DEL. So the total delay is the sum of (WL_DL_ABS_OFFSET/256*cycle) + (WL_HC_DEL*half cycle) + (WL_CYC_DEL*cycle).</p> <p>When SW write-leveling is enabled (i.e. SW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_CYC_DEL. When HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will indicate (status) whether a delay of half cycle was added or not to the associated WL_DL_OFFSET and WL_CYC_DEL.</p>

Table continues on the next page...

MMDC_MPWLDECTRL0 field descriptions (continued)

Field	Description
	<p>0 No delay is added.</p> <p>1 Half cycle delay is added.</p>
23 Reserved	This read-only field is reserved and always has the value 0.
22–16 WL_DL_ABS_OFFSET1	<p>Absolute write-leveling delay offset for Byte 1. This field indicates the absolute delay between CK and write DQS of Byte1 with fractions of a clock period and up to half cycle. This value is process and frequency independent. The value of the delay can be calculated using the following equation $(WR_DL_ABS_OFFSET1 / 256) * \text{clock period}$</p> <p>When SW write-leveling is enabled (i.e. SW_WL_EN = 1) then this value will be taken as is to the associated delay-line. When HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will indicate (status) the value that is taken to the associated delay-line at the end of the write-leveling calibration.</p> <p>NOTE: The delay-line has a resolution that may vary between device to device, therefore in some cases an increment of the delay by 1 step may be smaller than the delay-line resolution.</p>
15–11 Reserved	This read-only field is reserved and always has the value 0.
10–9 WL_CYC_DELO	<p>Write leveling cycle delay for Byte 0. This field indicates whether a delay of 1 or 2 cycles between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_HC_DEL. So the total delay is the sum of $(WL_DL_ABS_OFFSET/256 * \text{cycle}) + (WL_HC_DEL * \text{half cycle}) + (WL_CYC_DEL * \text{cycle})$.</p> <p>When both SW write-leveling is enabled (i.e. SW_WL_EN = 1) or HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_HC_DEL.</p> <p>Note that in HW write-leveling this field is not used for indication, as in WL_DL_OFFSET and WL_HC_DEL, but for configuration.</p> <p>0 No delay is added.</p> <p>1 1 cycle delay is added.</p> <p>2 2 cycles delay is added.</p> <p>3 Reserved.</p>
8 WL_HC_DELO	<p>Write leveling half cycle delay for Byte 0. This field indicates whether a delay of half cycle between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_CYC_DEL. So the total delay is the sum of $(WL_DL_ABS_OFFSET/256 * \text{cycle}) + (WL_HC_DEL * \text{half cycle}) + (WL_CYC_DEL * \text{cycle})$.</p> <p>When SW write-leveling is enabled (i.e. SW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_CYC_DEL. When HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will indicate (status) whether a delay of half cycle was added or not to the associated WL_DL_OFFSET and WL_CYC_DEL.</p> <p>0 No delay is added.</p> <p>1 Half cycle delay is added.</p>
7 Reserved	This read-only field is reserved and always has the value 0.
WL_DL_ABS_OFFSET0	Absolute write-leveling delay offset for Byte 0. This field indicates the absolute delay between CK and write DQS of Byte0 with fractions of a clock period and up to half cycle. This value is process and frequency independent. The value of the delay can be calculated using the following equation $(WR_DL_ABS_OFFSET0 / 256) * \text{clock period}$

Table continues on the next page...

MMDC_MPWLDECTRL0 field descriptions (continued)

Field	Description
	<p>When SW write-leveling is enabled (i.e. SW_WL_EN = 1) then this value will be taken as is to the associated delay-line. When HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will indicate (status) the value that is taken to the associated delay-line at the end of the write-leveling calibration.</p> <p>NOTE: The delay-line has a resolution that may vary between device to device, therefore in some cases an increment of the delay by 1 step may be smaller than the delay-line resolution.</p>

36.12.35 MMDC PHY Write Leveling delay-line Status Register (MMDC_MPWLDLST)

This register holds the status of the four write leveling delay-lines.

Address: 21B_0000h base + 814h offset = 21B_0814h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved								Reserved							
W	Reserved								Reserved							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	Reserved								Reserved							
W	Reserved								Reserved							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	WL_DL_UNIT_NUM1								WL_DL_UNIT_NUM0							

MMDC_MPWLDLST field descriptions

Field	Description
31 -	This field is reserved. Reserved
30–24 -	This field is reserved. Reserved
23 -	This field is reserved. Reserved
22–16 -	This field is reserved. Reserved
15 -	This field is reserved. Reserved
14–8 WL_DL_UNIT_NUM1	This field reflects the number of delay units that are actually used by write leveling delay-line 1.
7 -	This field is reserved. Reserved
WL_DL_UNIT_NUM0	This field reflects the number of delay units that are actually used by write leveling delay-line 0.

36.12.36 MMDC PHY ODT control register (MMDC_MPODTCTRL)

NOTE

In LPDDR2 mode this register should be cleared, so no termination will be activated

Address: 21B_0000h base + 818h offset = 21B_0818h

MMDC_MPODTCTRL field descriptions

Field	Description
31–19 Reserved	This read-only field is reserved and always has the value 0.
18–16 -	This field is reserved. Reserved
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT1_INT_RES	On chip ODT byte1 resistor - This field determines the Rtt_Nom of the on chip ODT byte1 resistor during read accesses. 0000 Rtt_Nom Disabled. 001 Rtt_Nom 120 Ohm 010 Rtt_Nom 60 Ohm 011 Rtt_Nom 40 Ohm 100 Rtt_Nom 30 Ohm 101 Rtt_Nom 24 Ohm 110 Rtt_Nom 20 Ohm 111 Rtt_Nom 17 Ohm
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 ODT0_INT_RES	On chip ODT byte0 resistor - This field determines the Rtt_Nom of the on chip ODT byte0 resistor during read accesses. 000 Rtt_Nom Disabled. 001 Rtt_Nom 120 Ohm 010 Rtt_Nom 60 Ohm 011 Rtt_Nom 40 Ohm 100 Rtt_Nom 30 Ohm 101 Rtt_Nom 24 Ohm 110 Rtt_Nom 20 Ohm 111 Rtt_Nom 17 Ohm
3 ODT_RD_ACT_EN	Active read CS ODT enable. The bit determines if ODT pin of the active CS will be asserted during read accesses. 0 Active CS ODT pin is disabled during read access. 1 Active CS ODT pin is enabled during read access.
2 ODT_RD_PAS_EN	Inactive read CS ODT enable. The bit determines if ODT pin of the inactive CS will be asserted during read accesses. 0 Inactive CS ODT pin is disabled during read accesses to other CS. 1 Inactive CS ODT pin is enabled during read accesses to other CS.
1 ODT_WR_ACT_EN	Active write CS ODT enable. The bit determines if ODT pin of the active CS will be asserted during write accesses.

Table continues on the next page...

Field	Description
	0 Active CS ODT pin is disabled during write access. 1 Active CS ODT pin is enabled during write access.
0 ODT_WR_PAS_EN	Inactive write CS ODT enable. The bit determines if ODT pin of the inactive CS will be asserted during write accesses. 0 Inactive CS ODT pin is disabled during write accesses to other CS. 1 Inactive CS ODT pin is enabled during write accesses to other CS.

36.12.37 MMDC PHY Read DQ Byte0 Delay Register (MMDC_MPRDDQBY0DL)

This register is used to add fine-tuning adjustment to every bit in the read DQ byte0 relative to the read DQS. This delay is in addition to the read data calibration. If operating in 64-bit mode, there is an identical register that is mapped at the second base address.

Address: 21B_0000h base + 81Ch offset = 21B_081Ch

MMDC_MPWRDQBY2DL field descriptions

Field	Description
31-30 wr_dm2_del	Write dm2 delay fine-tuning. This field holds the number of delay units that are added to dm2 relative to dqs2. 00 No change in dm2 delay 01 Add dm2 delay of 1 delay unit. 10 Add dm2 delay of 2 delay units. 11 Add dm2 delay of 3 delay units.
29-28 wr_dq23_del	Write dq23 delay fine tuning. This field holds the number of delay units that are added to dq23 relative to dqs2. 00 No change in dq23 delay 01 Add dq23 delay of 1 delay unit.

Table continues on the next page...

MMDC_MPWRDQBY2DL field descriptions (continued)

Field	Description
	10 Add dq23 delay of 2 delay units. 11 Add dq23 delay of 3 delay units.
27–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 wr_dq22_del	Write dq22 delay fine tuning. This field holds the number of delay units that are added to dq22 relative to dqs2. 00 No change in dq22 delay 01 Add dq22 delay of 1 delay unit. 10 Add dq22 delay of 2 delay units. 11 Add dq22 delay of 3 delay units.
23–22 Reserved	This read-only field is reserved and always has the value 0.
21–20 wr_dq21_del	Write dq21 delay fine tuning. This field holds the number of delay units that are added to dq21 relative to dqs2. 00 No change in dq21 delay 01 Add dq21 delay of 1 delay unit. 10 Add dq21 delay of 2 delay units. 11 Add dq21 delay of 3 delay units.
19–18 Reserved	This read-only field is reserved and always has the value 0.
17–16 wr_dq20_del	Write dq20 delay fine tuning. This field holds the number of delay units that are added to dq20 relative to dqs2. 00 No change in dq20 delay 01 Add dq20 delay of 1 delay unit. 10 Add dq20 delay of 2 delay units. 11 Add dq20 delay of 3 delay units.
15–14 Reserved	This read-only field is reserved and always has the value 0.
13–12 wr_dq19_del	Write dq19 delay fine tuning. This field holds the number of delay units that are added to dq19 relative to dqs2. 00 No change in dq19 delay 01 Add dq19 delay of 1 delay unit. 10 Add dq19 delay of 2 delay units. 11 Add dq19 delay of 3 delay units.
11–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 wr_dq18_del	Write dq18 delay fine tuning. This field holds the number of delay units that are added to dq18 relative to dqs2. 00 No change in dq18 delay 01 Add dq18 delay of 1 delay unit. 10 Add dq18 delay of 2 delay units. 11 Add dq18 delay of 3 delay units.

Table continues on the next page...

MMDC_MPWRDQBY2DL field descriptions (continued)

Field	Description
7-6 Reserved	This read-only field is reserved and always has the value 0.
5-4 wr_dq17_del	Write dq17 delay fine tuning. This field holds the number of delay units that are added to dq17 relative to dqs2. 00 No change in dq17 delay 01 Add dq17 delay of 1 delay unit. 10 Add dq17 delay of 2 delay units. 11 Add dq17 delay of 3 delay units.
3-2 Reserved	This read-only field is reserved and always has the value 0.
wr_dq16_del	Write dq16 delay fine tuning. This field holds the number of delay units that are added to dq16 relative to dqs2. 00 No change in dq16 delay 01 Add dq16 delay of 1 delay unit. 10 Add dq16 delay of 2 delay units. 11 Add dq16 delay of 3 delay units.

36.12.42 MMDC PHY Write DQ Byte3 Delay Register (MMDC_MPWRDQBY3DL)

This register is used to add fine-tuning adjustment to every bit in the write DQ byte3 relative to the write DQS

Address: 21B_0000h base + 838h offset = 21B_0838h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDC_MPWRDQBY3DL field descriptions

Field	Description
31-30 wr_dm3_del	Write dm3 delay fine tuning. This field holds the number of delay units that are added to dm3 relative to dqs3. 00 No change in dm3 delay 01 Add dm3 delay of 1 delay unit.

Table continues on the next page...

MMDC_MPWRDQBY3DL field descriptions (continued)

Field	Description
	10 Add dm3 delay of 2 delay units. 11 Add dm3 delay of 3 delay units.
29–28 wr_dq31_del	Write dq31 delay fine tuning. This field holds the number of delay units that are added to dq31 relative to dqs3. 00 No change in dq31 delay 01 Add dq31 delay of 1 delay unit. 10 Add dq31 delay of 2 delay units. 11 Add dq31 delay of 3 delay units.
27–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 wr_dq30_del	Write dq30 delay fine tuning. This field holds the number of delay units that are added to dq30 relative to dqs3. 00 No change in dq30 delay 01 Add dq30 delay of 1 delay unit. 10 Add dq30 delay of 2 delay units. 11 Add dq30 delay of 3 delay units.
23–22 Reserved	This read-only field is reserved and always has the value 0.
21–20 wr_dq29_del	Write dq29 delay fine tuning. This field holds the number of delay units that are added to dq29 relative to dqs3. 00 No change in dq29 delay 01 Add dq29 delay of 1 delay unit. 10 Add dq29 delay of 2 delay units. 11 Add dq29 delay of 3 delay units.
19–18 Reserved	This read-only field is reserved and always has the value 0.
17–16 wr_dq28_del	Write dq28 delay fine tuning. This field holds the number of delay units that are added to dq28 relative to dqs3. 00 No change in dq28 delay 01 Add dq28 delay of 1 delay unit. 10 Add dq28 delay of 2 delay units. 11 Add dq28 delay of 3 delay units.
15–14 Reserved	This read-only field is reserved and always has the value 0.
13–12 wr_dq27_del	Write dq27 delay fine tuning. This field holds the number of delay units that are added to dq27 relative to dqs3. 00 No change in dq27 delay 01 Add dq27 delay of 1 delay unit. 10 Add dq27 delay of 2 delay units. 11 Add dq27 delay of 3 delay units.
11–10 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MPWRDQBY3DL field descriptions (continued)

Field	Description
9–8 wr_dq26_del	Write dq26 delay fine tuning. This field holds the number of delay units that are added to dq26 relative to dqs3. 00 No change in dq26 delay 01 Add dq26 delay of 1 delay unit. 10 Add dq26 delay of 2 delay units. 11 Add dq26 delay of 3 delay units.
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–4 wr_dq25_del	Write dq25 delay fine tuning. This field holds the number of delay units that are added to dq25 relative to dqs3. 00 No change in dq25 delay 01 Add dq25 delay of 1 delay unit. 10 Add dq25 delay of 2 delay units. 11 Add dq25 delay of 3 delay units.
3–2 Reserved	This read-only field is reserved and always has the value 0.
wr_dq24_del	Write dq24 delay fine tuning. This field holds the number of delay units that are added to dq24 relative to dqs3. 00 No change in dq24 delay 01 Add dq24 delay of 1 delay unit. 10 Add dq24 delay of 2 delay units. 11 Add dq24 delay of 3 delay units.

36.12.43 MMDC PHY Read DQS Gating Control Register 0 (MMDC_MPDGCTRL0)

Address: 21B_0000h base + 83Ch offset = 21B_083Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDC_MPDGCTRL0 field descriptions

Field	Description
31 RST_RD_FIFO	Reset Read Data FIFO and associated pointers. If this bit is asserted then the MMDC resets the read data FIFO and the associated pointers. This bit is self cleared after the FIFO reset is done.
30 DG_CMP_CYC	Read DQS gating sample cycle. If this bit is asserted then the MMDC waits 32 cycles before comparing the read data, Otherwise it waits 16 DDR cycles. 0 MMDC waits 16 DDR cycles 1 MMDC waits 32 DDR cycles
29 DG_DIS	Read DQS gating disable. If this bit is asserted then the MMDC disables the read DQS gating mechanism. If this bits is asserted (read DQS gating is disabled) then pull-up and pull-down resistors suppose to be used on DQS and DQS# respectively 0 Read DQS gating mechanism is enabled 1 Read DQS gating mechanism is disabled
28 HW_DG_EN	Enable automatic read DQS gating calibration. If this bit is asserted then the MMDC performs automatic read DQS gating calibration. HW negates this bit upon completion of the automatic read DQS gating.

Table continues on the next page...

MMDC_MPDGCTRL0 field descriptions (continued)

Field	Description
	<p>Note:</p> <p>Before issuing the first read command the MMDC counts 12 cycles.</p> <p>In LPDDR2 mode automatic (HW) read DQS gating should be disabled and Pull-up/pull-down resistors on DQS/DQS# should be enabled while ODT resistors must be disconnected.</p> <p>0 Disable automatic read DQS gating calibration 1 Start automatic read DQS gating calibration</p>
27–24 DG_HC_DEL1	<p>Read DQS gating half cycles delay for Byte1</p> <p>. This field indicates the delay in half cycles between read DQS gate and the middle of the read DQS preamble of Byte1. This delay is added to the delay that is generated by the read DQS1 gating delay-line, So the total read DQS gating delay is $(DG_HC_DEL\#)*0.5*cycle + (DG_DL_ABS_OFFSET\#)*1/256*cycle$</p> <p>Upon completion of the automatic read DQS gating calibration this field gets the value of the 4 MSB of $((HW_DG_LOW1 + HW_DG_UP1) / 2)$.</p> <p>0000 0 cycles delay. 0001 Half cycle delay. 0010 1 cycle delay 1101 6.5 cycles delay 1110 Reserved 1111 Reserved</p>
23 DG_EXT_UP	<p>DG extend upper boundary. By default the upper boundary of DQS gating HW calibration is set according to first failing comparison after at least one passing comparison. If this bit is asserted then the upper boundary is set according to the last passing comparison.</p>
22–16 DG_DL_ABS_OFFSET1	<p>Absolute read DQS gating delay offset for Byte1. This field indicates the absolute delay between read DQS gate and the middle of the read DQS preamble of Byte1 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be $(DG_DL_ABS_OFFSET1 / 256)* MMDC AXI clock (fast clock)$.</p> <p>This field can also bit written by HW. Upon completion of the automatic read DQS gating calibration this field gets the value of the 7 LSB of $((HW_DG_LOW1 + HW_DG_UP1) / 2)$.</p> <p>Note that not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.</p>
15–13 Reserved	<p>This read-only field is reserved and always has the value 0.</p>
12 HW_DG_ERR	<p>HW DQS gating error. This bit valid is asserted when an error was found during the read DQS gating HW calibration process. Error can occur when no valid value was found during HW calibration.</p> <p>This bit is valid only after HW_DG_EN is de-asserted.</p> <p>0 No error was found during the DQS gating HW calibration process. 1 An error was found during the DQS gating HW calibration process.</p>
11–8 DG_HC_DEL0	<p>Read DQS gating half cycles delay for Byte0</p> <p>. This field indicates the delay in half cycles between read DQS gate and the middle of the read DQS preamble of Byte0/4. This delay is added to the delay that is generated by the read DQS1 gating delay-line, So the total read DQS gating delay is $(DG_HC_DEL\#)*0.5*cycle + (DG_DL_ABS_OFFSET\#)*1/256*cycle$</p> <p>Upon completion of the automatic read DQS gating calibration this field gets the value of the 4 MSB of $((HW_DG_LOW1 + HW_DG_UP1) / 2)$.</p> <p>0000 0 cycles delay.</p>

Table continues on the next page...

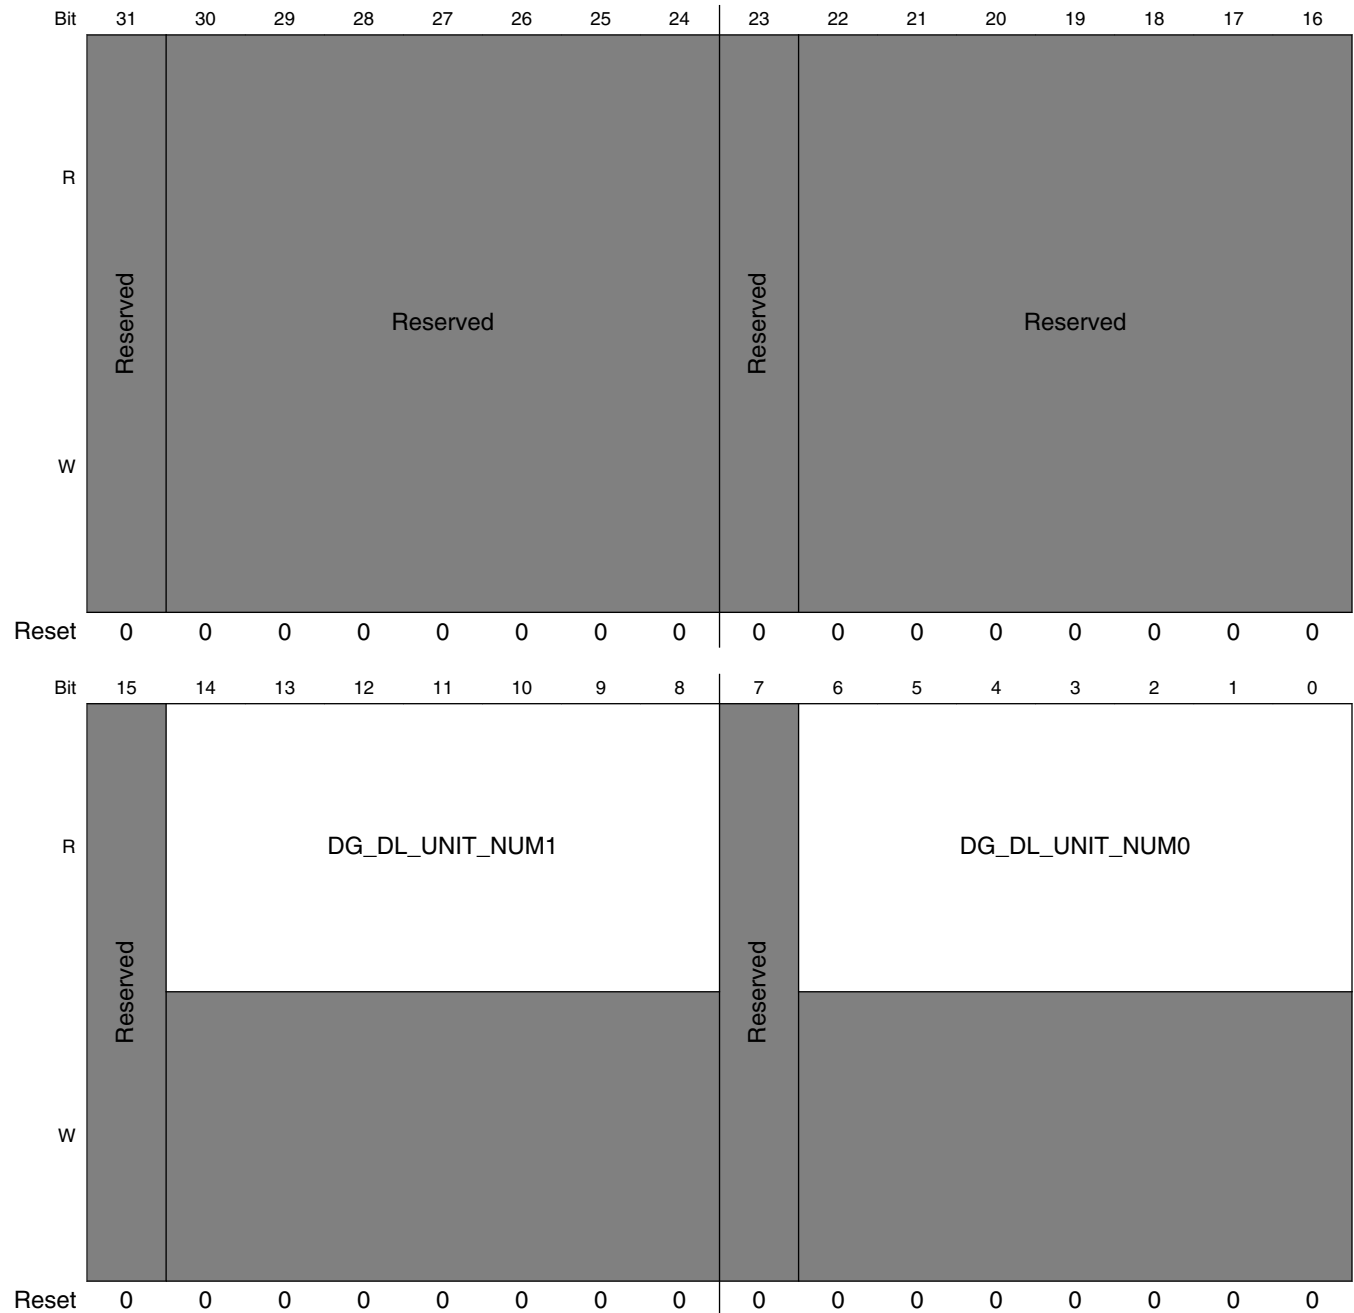

MMDC_MPDGCTRL0 field descriptions (continued)

Field	Description
	0001 Half cycle delay. 0010 1 cycle delay 1101 6.5 cycles delay 1110 Reserved 1111 Reserved
7 Reserved	This read-only field is reserved and always has the value 0.
DG_DL_ABS_ OFFSET0	<p>Absolute read DQS gating delay offset for Byte0. This field indicates the absolute delay between read DQS gate and the middle of the read DQS preamble of Byte0 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be $(DG_DL_ABS_OFFSET0 / 256) * \text{MMDC AXI clock (fast clock)}$.</p> <p>This field can also be written by HW. Upon completion of the automatic read DQS gating calibration this field gets the value of the 7 LSB of $((HW_DG_LOW0 + HW_DG_UP0) / 2)$.</p> <p>Note that not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.</p>

36.12.44 MMDC PHY Read DQS Gating delay-line Status Register (MMDC_MPDGDLST0)

This register holds the status of the 4 dqs gating delay-lines.

Address: 21B_0000h base + 844h offset = 21B_0844h

MMDC_MPDGDLST0 field descriptions

Field	Description
31 -	This field is reserved. Reserved
30–24 -	This field is reserved. Reserved
23 -	This field is reserved. Reserved
22–16 -	This field is reserved. Reserved
15 -	This field is reserved. Reserved
14–8 DG_DL_UNIT_ NUM1	This field reflects the number of delay units that are actually used by read DQS gating delay-line 1.
7 -	This field is reserved. Reserved
DG_DL_UNIT_ NUM0	This field reflects the number of delay units that are actually used by read DQS gating delay-line 0.

36.12.45 MMDC PHY Read delay-lines Configuration Register (MMDC_MPRDDLCTL)

This register controls read delay-lines functionality; it determines DQS delay relative to the associated DQ read access. The delay-line compensates for process variations and produces a constant delay regardless of the process, temperature and voltage.

Address: 21B_0000h base + 848h offset = 21B_0848h

MMDC_MPRDDLCTL field descriptions

	0x7E 508 cycles 0x7F 512 cycles
23–16 ZQ_LP2_HW_ ZQCL	This register defines the period in cycles that it takes the memory device to perform a long ZQ calibration. This is the period of time that the MMDC has to wait after sending a long ZQ calibration and before sending other commands. 0x0-0x36 Reserved 0x37 112 cycles 0x38 114 cycles 0x5F 192 cycles (Default, JEDEC value, tZQCL, for LPDDR2, 360ns @ clock frequency 533MHz) 0xFE 510 cycles 0xFF 512 cycles
15–9 Reserved	This read-only field is reserved and always has the value 0.
ZQ_LP2_HW_ ZQINIT	This register defines the period in cycles that it takes the memory device to perform a Init ZQ calibration. This is the period of time that the MMDC has to wait after sending a init ZQ calibration and before sending other commands. 0x0-0x36 Reserved 0x37 112 cycles 0x38 114 cycles 0x109 532 cycles (Default, JEDEC value, tZQINIT, for LPDDR2, 1us @ clock frequency 533MHz) 0x1FE 1022 cycles 0x1FF 1024 cycles

36.12.51 MMDC PHY Read Delay HW Calibration Control Register (MMDC_MPRDDLHWCTL)

Address: 21B_0000h base + 860h offset = 21B_0860h

MMDC_MPRDDLHWCTL field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 HW_RD_DL_CMP_CYC	Automatic (HW) read sample cycle. If this bit is asserted then the MMDC will compare the read data 32 cycles after the MMDC sent the read command enable pulse else it compares the data after 16 cycles.
4 HW_RD_DL_EN	Enable automatic (HW) read calibration. If this bit is asserted then the MMDC will perform an automatic read calibration. HW should negate this bit upon completion of the calibration. Negation of this bit also points that the read calibration results are valid Note: Before issuing the first read command MMDC counts 12 cycles.
3 -	This field is reserved. Reserved
2 -	This field is reserved. Reserved
1 HW_RD_DL_ERR1	Automatic (HW) read calibration error of Byte1. If this bit is asserted then it indicates that an error was found during the HW calibration process of read delay-line 1. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPRDDLHWST0 register. This bit is valid only after HW_RD_DL_EN is de-asserted.

Table continues on the next page...

MMDC_MPRDDLHWCTL field descriptions (continued)

Field	Description
	0 No error was found in read delay-line 1 during the automatic (HW) read calibration process of read delay-line 1. 1 An error was found in read delay-line 1 during the automatic (HW) read calibration process of read delay-line 1.
0 HW_RD_DL_ ERRO	Automatic (HW) read calibration error of Byte0. If this bit is asserted then it indicates that an error was found during the HW calibration process of read delay-line 0. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPRDDLHWST0 register. This bit is valid only after HW_RD_DL_EN is de-asserted. 0 No error was found in read delay-line 0 during the automatic (HW) read calibration process of read delay-line 0. 1 An error was found in read delay-line 0 during the automatic (HW) read calibration process of read delay-line 0.

36.12.52 MMDC PHY Write Delay HW Calibration Control Register (MMDC_MPWRDLHWCTL)

MMDC_MPDGHWST0 field descriptions

Field	Description
31–27 -	This field is reserved. Reserved
26–16 HW_DG_UP0	HW DQS gating calibration result of the upper boundary of Byte0. This field holds the HW DQS gating calibration result of the upper boundary of Byte0.
15–11 -	This field is reserved. Reserved
HW_DG_LOW0	HW DQS gating calibration result of the lower boundary of Byte0. This field holds the HW DQS gating calibration result of the lower boundary of Byte0.

36.12.57 MMDC PHY Read DQS Gating HW Status Register 1 (MMDC_MPDGHWST1)

Address: 21B_0000h base + 880h offset = 21B_0880h

MMDC_MPDGHWST1 field descriptions

Field	Description
31–27 -	This field is reserved. Reserved
26–16 HW_DG_UP1	HW DQS gating calibration result of the upper boundary of Byte1. This field holds the HW DQS gating calibration result of the upper boundary of Byte1.
15–11 -	This field is reserved. Reserved
HW_DG_LOW1	HW DQS gating calibration result of the lower boundary of Byte1. This field holds the HW DQS gating calibration result of the lower boundary of Byte1.

36.12.58 MMDC PHY Pre-defined Compare Register 1 (MMDC_MPPDCMPR1)

This register holds the MMDC pre-defined compare value that will be used during automatic read, read DQS gating and write calibration process. The compare value can be the MPR value (as defined in the JEDEC) or can be programmed by the PDV1 and PDV2 fields. In case of DDR3 (BL=8) the MMDC will duplicate PDV1, PDV2 and drive that data on Beat4-7 of the same byte

Address: 21B_0000h base + 88Ch offset = 21B_088Ch

MMDC_MPPDCMPR1 field descriptions

Field	Description
31–16 PDV2	MMDC Pre defined compare value2. This field holds the 2 MSB of the data that will be driven to the DDR device during automatic read, read DQS gating and write calibrations in case MPR(DDR3)/ DQ calibration

Table continues on the next page...

MMDC_MPPDCMPR1 field descriptions (continued)

Field	Description
	<p>(LPDDR2/LPDDR3) mode are disabled (MPR_CMP is disabled). Upon read access during the calibration the MMDC will compare the read data with the data that is stored in this field.</p> <p>Note : Before issue the read access the MMDC will invert the value of this field and drive it to the associate entry in the read comparison FIFO. For further information see Section 19.14.3.1.2, "Calibration with pre-defined value , Section 19.14.4.1.2, "Calibration with pre-defined value and Section 19.14.5.1, "HW (automatic) Write Calibration</p>
PDV1	<p>MMDC Pre defined compare value2. This field holds the 2 LSB of the data that will be driven to the DDR device during automatic read, read DQS gating and write calibrations in case MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) mode are disabled (MPR_CMP is disabled). Upon read access during the calibration the MMDC will compare the read data with the data that is stored in this field.</p> <p>NOTE: Before issuing the read access, the MMDC will invert the value of this field and drive it to the associated entry in the read comparison FIFO.</p>

36.12.59 MMDC PHY Pre-defined Compare and CA delay-line Configuration Register (MMDC_MPPDCMPR2)

Address: 21B_0000h base + 890h offset = 21B_0890h

MMDC_MPPDCMPR2 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–24 PHY_CA_DL_UNIT	This field reflects the number of delay units that are actually used by CA(Command/Address of LPDDR2) delay-line
23 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MPPDCMPR2 field descriptions (continued)

Field	Description																																																
22–16 CA_DL_ABS_OFFSET	Absolute CA (Command/Address of LPDDR2) offset. This field indicates the absolute delay between CA (Command/Address) bus and the DDR clock (CK) with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be $(CA_DL_ABS_OFFSET / 256) * \text{MMDC AXI clock (fast clock)}$. So for the default value of 64 we get a quarter cycle delay.																																																
15–12 Reserved	This read-only field is reserved and always has the value 0.																																																
11–8 ZQ_PU_OFFSET	<p>Programmable offset from -7 to 7 added to the MMDC_MPZQHWCTRL[ZQ_HW_PU_RES] field when ZQ_OFFSET_EN is enabled.</p> <p>Bit[11] determines direction: 'b0 = Offset is added to ZQ_HW_PU_RES field 'b1 = Offset is subtracted from ZQ_HW_PU_RES field</p> <p>Bits[10:8] = Amount of change to apply.</p> <table> <tr><td>0000</td><td>0</td><td>— Offset is added to ZQ_HW_PU_RES field</td></tr> <tr><td>0001</td><td>1</td><td>— Offset is added to ZQ_HW_PU_RES field</td></tr> <tr><td>0010</td><td>2</td><td>— Offset is added to ZQ_HW_PU_RES field</td></tr> <tr><td>0011</td><td>3</td><td>— Offset is added to ZQ_HW_PU_RES field</td></tr> <tr><td>0100</td><td>4</td><td>— Offset is added to ZQ_HW_PU_RES field</td></tr> <tr><td>0101</td><td>5</td><td>— Offset is added to ZQ_HW_PU_RES field</td></tr> <tr><td>0110</td><td>6</td><td>— Offset is added to ZQ_HW_PU_RES field</td></tr> <tr><td>0111</td><td>7</td><td>— Offset is added to ZQ_HW_PU_RES field</td></tr> <tr><td>1000</td><td>0</td><td>— Offset is subtracted from ZQ_HW_PU_RES field</td></tr> <tr><td>1001</td><td>1</td><td>— Offset is subtracted from ZQ_HW_PU_RES field</td></tr> <tr><td>1010</td><td>2</td><td>— Offset is subtracted from ZQ_HW_PU_RES field</td></tr> <tr><td>1011</td><td>3</td><td>— Offset is subtracted from ZQ_HW_PU_RES field</td></tr> <tr><td>1100</td><td>4</td><td>— Offset is subtracted from ZQ_HW_PU_RES field</td></tr> <tr><td>1101</td><td>5</td><td>— Offset is subtracted from ZQ_HW_PU_RES field</td></tr> <tr><td>1110</td><td>6</td><td>— Offset is subtracted from ZQ_HW_PU_RES field</td></tr> <tr><td>1111</td><td>7</td><td>— Offset is subtracted from ZQ_HW_PU_RES field</td></tr> </table>	0000	0	— Offset is added to ZQ_HW_PU_RES field	0001	1	— Offset is added to ZQ_HW_PU_RES field	0010	2	— Offset is added to ZQ_HW_PU_RES field	0011	3	— Offset is added to ZQ_HW_PU_RES field	0100	4	— Offset is added to ZQ_HW_PU_RES field	0101	5	— Offset is added to ZQ_HW_PU_RES field	0110	6	— Offset is added to ZQ_HW_PU_RES field	0111	7	— Offset is added to ZQ_HW_PU_RES field	1000	0	— Offset is subtracted from ZQ_HW_PU_RES field	1001	1	— Offset is subtracted from ZQ_HW_PU_RES field	1010	2	— Offset is subtracted from ZQ_HW_PU_RES field	1011	3	— Offset is subtracted from ZQ_HW_PU_RES field	1100	4	— Offset is subtracted from ZQ_HW_PU_RES field	1101	5	— Offset is subtracted from ZQ_HW_PU_RES field	1110	6	— Offset is subtracted from ZQ_HW_PU_RES field	1111	7	— Offset is subtracted from ZQ_HW_PU_RES field

MMDC_MPPDCMPR2 field descriptions (continued)

Field	Description
	1001 1 — Offset is subtracted from ZQ_HW_PD_RES field 1010 2 — Offset is subtracted from ZQ_HW_PD_RES field 1011 3 — Offset is subtracted from ZQ_HW_PD_RES field 1100 4 — Offset is subtracted from ZQ_HW_PD_RES field 1101 5 — Offset is subtracted from ZQ_HW_PD_RES field 1110 6 — Offset is subtracted from ZQ_HW_PD_RES field 1111 7 — Offset is subtracted from ZQ_HW_PD_RES field
3 ZQ_OFFSET_EN	0 Hardware ZQ offset disabled 1 Hardware ZQ offset enabled
2 READ_LEVEL_PATTERN	MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) read compare pattern. In case MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) modes are used during the calibration process (MPR_CMP is asserted) then this field indicates the read pattern for the comparison. 0 Compare with read pattern 1010 1 Compare with read pattern 0011 (Used only in LPDDR2/LPDDR3 mode)
1 MPR_FULL_CMP	MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) full compare enable. In case MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) modes are used during the calibration process (MPR_CMP is asserted) then this field indicates whether the MMDC will compare all the bits of the data that is read from the DDR device to the MPR pre-defined pattern. When this bit is de-asserted only LSB of each byte is compared.
0 MPR_CMP	MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) compare enable. This bit indicates whether the MMDC will compare the read data during automatic read and read DQS calibration processes to the pre-defined patterns that are driven by the DDR device (READ_LEVEL_PATTERN as defined by JEDEC) or general pre-defined value that are stored in PDV1 and PDV2. When this bit is disabled data is compared to the data of the pre defined compare value field For further information see Read DQS Gating Calibration and Read Calibration .

36.12.60 MMDC PHY SW Dummy Access Register (MMDC_MPSWDAR0)

MMDC_MPSWDAR0 field descriptions (continued)

Field	Description
	compared to MPPDCMPR1[PDV1], MPPDCMPR1[PDV2]. Upon completion of the access this bit is de-asserted automatically and the read data and comparison results are valid at MPSWDAR0[SW_DUM_CMP#] and MPSWDRDR0-MPSWDRDR7 respectively.
0 SW_DUMMY_ WR	SW dummy write. When this bit is asserted the MMDC will generate internally write access without intervention of the system toward bank 0, row 0, column 0, while the data is driven from MPPDCMPR1[PDV1] and MPPDCMPR1[PDV2]. The bit is de-asserted automatically upon completion of the access.

36.12.61 MMDC PHY SW Dummy Read Data Register 0 (MMDC_MPSWDRDR0)

Address: 21B_0000h base + 898h offset = 21B_0898h

MMDC_MPSWDRDR1 field descriptions

Field	Description
DUM_RD1	Dummy read data1. This field holds the second data that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted

36.12.63 MMDC PHY SW Dummy Read Data Register 2 (MMDC_MPSWDRDR2)

Address: 21B_0000h base + 8A0h offset = 21B_08A0h

MMDC_MPSWDRDR2 field descriptions

Field	Description
DUM_RD2	Dummy read data2. This field holds the third data that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted.

36.12.64 MMDC PHY SW Dummy Read Data Register 3 (MMDC_MPSWDRDR3)

Address: 21B_0000h base + 8A4h offset = 21B_08A4h

MMDC_MPSWDRDR3 field descriptions

Field	Description
DUM_RD3	Dummy read data3. This field holds the fourth data that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted.

36.12.65 MMDC PHY SW Dummy Read Data Register 4 (MMDC_MPSWDRDR4)

Address: 21B_0000h base + 8A8h offset = 21B_08A8h

MMDC_MPSWDRDR4 field descriptions

Field	Description
DUM_RD4	Dummy read data4. This field holds the fifth data (only in case of burst length 8 (BL =1)) that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted.

36.12.66 MMDC PHY SW Dummy Read Data Register 5 (MMDC_MPSWDRDR5)

Address: 21B_0000h base + 8ACh offset = 21B_08ACh

MMDC_MPSWDRDR6 field descriptions

Field	Description
DUM_RD6	Dummy read data6. This field holds the seventh data (only in case of burst length 8 (BL =1)) that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted.

36.12.68 MMDC PHY SW Dummy Read Data Register 7 (MMDC_MPSWDRDR7)

Address: 21B_0000h base + 8B4h offset = 21B_08B4h

MMDC_MPSWDRDR7 field descriptions

Field	Description
DUM_RD7	Dummy read data7. This field holds the eight data (only in case of burst length 8 (BL = 1)) that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted.

36.12.69 MMDC PHY Measure Unit Register (MMDC_MPMUR0)

Address: 21B_0000h base + 8B8h offset = 21B_08B8h

MMDC_MPMUR0 field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–16 MU_UNIT_DEL_NUM	Number of delay units measured per cycle. This field is used in debug mode and holds the number of delay units that were measured by the measure unit per DDR clock cycle. The delay-lines that are used in every calibration process use that number for generating the desired delay.
15–12 Reserved	This read-only field is reserved and always has the value 0.
11 FRC_MSR	Force measurement on delay-lines. When this bit is asserted then a measurement process will be performed, where at the completion of the process the delay-lines will issue the desired delay. Upon completion of the measurement process the measure unit and the delay-lines will return to functional mode. This bit is self cleared.

Table continues on the next page...

MMDC_MPMURO field descriptions (continued)

Field	Description
	<p>NOTE: This bit should be used only during manual (SW) calibration and not while the DDR is functional (being accessed). After initial calibration is done the hardware performs periodic measurements to track any operating conditions changes. Hence, force measurements (FRC_MSR) should not be used. See Calibration Process for more information.</p> <p>NOTE: User should make sure that there is no active accesses to/from DDR before asserting this bit.</p> <p>0 No measurement is performed 1 Perform measurement process</p>
10 MU_BYP_EN	<p>Measure unit bypass enable. This field is used in debug mode and when it is asserted then the delay-lines will use the number of delay units that are indicated at MU_BYP_VAL, otherwise the delay-lines will use the number of delay units that was measured by the measurement unit and are indicated at MU_UNIT_DEL_NUM</p> <p>0 The delay-lines use delay units as indicated at MU_UNIT_DEL_NUM. 1 The delay-lines use delay units as indicated at MU_BYPASS_VAL.</p>
MU_BYP_VAL	Number of delay units for measurement bypass. This field is used in debug mode and holds the number of delay units that will be used by the delay-lines when MU_BYP_EN is asserted.

36.12.70 MMDC Write CA delay-line controller (MMDC_MPWRCADL)

This register is used to add fine-tuning adjustment to the CA (command/Address of LPDDR2 bus) relative to the DDR clock

This field holds the number of delay units that are added to CA (Command/Address bus) bit 1 relative to the clock. 00 No change in CA1 delay 01 Add CA1 delay of 1 delay unit 10 Add CA1 delay of 2 delay units. 11 Add CA1 delay of 3 delay units.
WR_CA0_DEL	CA(Command/Address LPDDR2 bus) bit 0 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 0 relative to the clock. 00 No change in CA0 delay 01 Add CA0 delay of 1 delay unit 10 Add CA0 delay of 2 delay units. 11 Add CA0 delay of 3 delay units.

36.12.71 MMDC Duty Cycle Control Register (MMDC_MPDCCR)

This register is used to control the duty cycle of the DQS and the primary clock (CK0). Programming of that register is permitted by entering the DDR device into self-refresh mode through LPMD/DVFS mechanism

NOTE

If the duty cycle is modified after DDR initialization, the DDR will have to be placed in self-refresh mode.

NOTE

The duty cycle may be changed during initial DDR initialization without having to be placed in self-refresh mode.

Address: 21B_0000h base + 8C0h offset = 21B_08C0h

Chapter 37

Medium Quality Sound (MQS)

37.1 Overview

Medium quality sound (MQS) is used to generate medium quality audio via a standard GPIO in the pinmux, allowing the user to connect stereo speakers or headphones to a power amplifier without an additional DAC chip.

MQS accepts 2-channel, LSB-valid 16bit, MSB shift-out first; frame sync asserting with the first bit of the frame, data shifted with the posedge of bit clock, 44.1 kHz or 48 kHz signals from SAI1 in left_justified format; and it provides the SNR target as no more than 20dB for the signals below 10 kHz. The signals above 10 kHz will have worse THD+N values.

MQS provides only simple audio reproduction. No internal pop, click or distortion artifact reduction methods are provided.

37.2 Block Diagram

Figure 37-1. Block Diagram

MQS has the following sub-modules:

1. Channel Split: Splits the I2S signals into separate left channel and right channel audio data.
2. Noise Shaping: Uses the sigma-delta algorithm to generate low-resolution, very high sampling audio, while the audio sampling rate is increased.
3. PWM generation: Generates the bit stream to the GPIO, which is then used to drive the amplifier and then to drive the external speakers or headphones.
4. mclk generation: Used to generate the master clock (mclk). The frequency of mclk is determined by the final bit duration of PWM generation module.
5. mclk control: Used as a metronome to co-ordinate the different functional blocks working synchronously.
6. Reset and Enable: Used to generate the reset and enable logic to different clock domains.

37.3 External Signals

The following table describes the external signals of MQS:

Table 37-1. MQS External Signals

Signal	Description	Pad	Mode	Direction
MQS_LEFT	Left signal output	GPIO1_IO01	ALT4	O
		JTAG_TDI	ALT6	

Table continues on the next page...

Table 37-1. MQS External Signals (continued)

Signal	Description	Pad	Mode	Direction
MQS_RIGHT	Right signal output	LCD_DATA23	ALT1	O
		GPIO1_IO00	ALT4	
		JTAG_TDO	ALT6	
		LCD_DATA22	ALT1	

37.4 Interface Signals

MQS module has the following interface signals.

Signal Name	In/Out	BitWidth	Description	Comments
reset_b	In	1	asynchronous reset	
software_reset	In	1	Software reset	From GPR
mqs_enable	In	1	module enable	From GPR
pwm_ovr	In	1	PWM oversampling ratio1—64, 0--32	From GPR
hmclk	In	1	Maximum bit clock, used to generate the mclk, divider ratio is controlled by mqs_hmclk_divide	Max 66.5MHzTypical 24.576MHz
hmclk_divide	In	8	Divider ration control for mclk from hmclk	From GPR
bclk	In	1	bit clock from I2S signal	
fs	In	1	frame sync clock from I2S signal	
sdata	In	1	serial audio data from I2S signal	

37.5 Programmability

MQS has no internal programmable registers. But it does have some programmability from IOMUXC_GPR2.

Register Bits	Name	Description
IOMUXC_GPR2[26]	MQS_OVERSAMPLE	Used to control the PWM oversampling rate compared with mclk. 1—64,

Table continues on the next page...

Usage Model

Register Bits	Name	Description
		0—32.
IOMUXC_GPR2[25]	MQS_EN	MQS enable. 1—Enable MQS, 0—Disable MQS
IOMUXC_GPR2[24]	MQS_SW_RST	MQS software reset. 1—Enable software reset for MQS 0—Exit software reset for MQS
IOMUXC_GPR2[23:16]	MQS_CLK_DIV[7:0]	Divider ration control for mclk from hmclk. 0—mclk frequency = hmclk frequency; 1—mclk frequency = $\frac{1}{2}$ *hmclk frequency; 2—mclk frequency = $\frac{1}{3}$ *hmclk frequency; ...; n—mclk frequency = $\frac{1}{(n+1)}$ *hmclk frequency

37.6 Usage Model

The user needs to program SAI1 to output 2-channel MSB-16bit active I2S signal, and then to program the related IOMUXC_GPR2 bits.

Due to the different devices connected to MQS, and different high frequency behaviors of the connected analog circuits, customer need choose the appropriate MQS_CLK_DIV and MQS_OVERSAMPLE values for the best audible effects.

Chapter 38

On-Chip OTP Controller (OCOTP_CTRL)

38.1 Overview

This section contains information describing the requirements for the on-chip eFuse OTP controller along with details about the block functionality and implementation.

In this document, the words "eFuse" and "OTP" are interchangeable. OCOTP refers to the hardware block itself.

38.1.1 Features

The OCOTP provides the following features :

- Loading and housing of fuse content into shadow registers.
- Generation of HWV_FUSE (hardware visible fuse bus) and the HWV_REG bus which is made of up of volatile PIO register based "fuses". The HWV_REG bits come from the SCS (Software Controllable Signals) register.
- Generation of STICKY_REG which is consist of sticky register bits.
- Provide program-protect and read-protect eFuse.
- Provide override and read protection of shadow register.
- CRC32 test for read-lock fuse content.

38.2 Clocks

The table found here describes the clock sources for OCOTP.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 38-1. OCOTP Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

38.3 Top-Level Symbol and Functional Overview

The figure found here shows the OCOTP system level diagram.

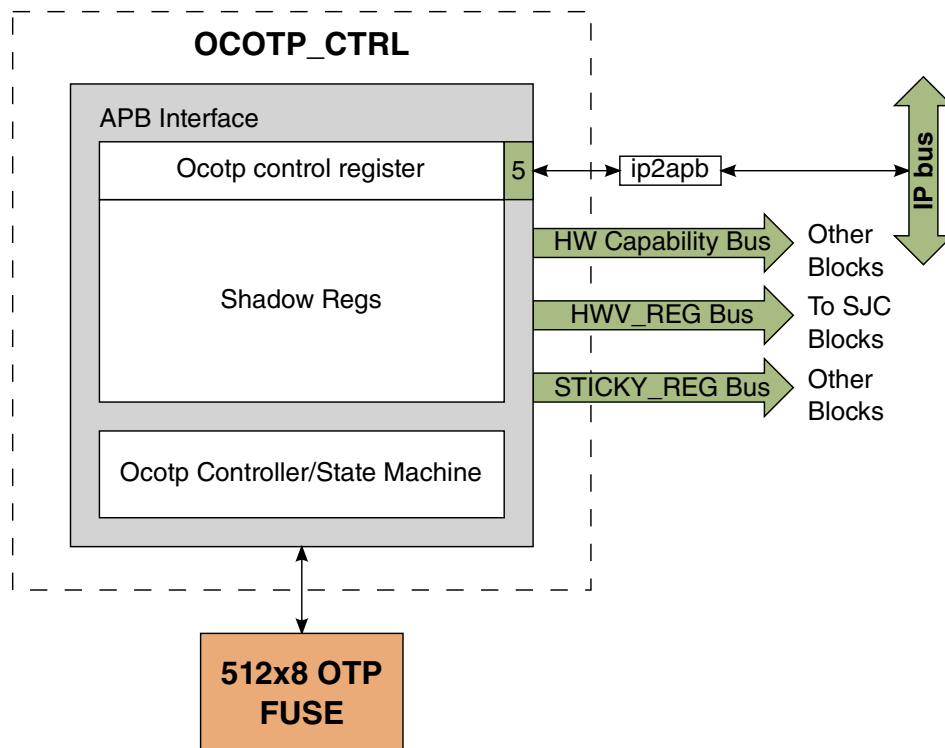

Figure 38-1. OCOTP System Level Diagram

38.3.1 Operation

The IP bus interface of the OCOTP provides two functions.

- Configure control registers for programming and reading fuse .
- Override and read shadow registers.

38.3.1.1 Shadow Register Reload

All fuse words in are shadowed. Therefore, fuse information is available through memory mapped shadow registers. If fuses are subsequently programmed, the shadow registers should be reloaded to keep them coherent with the fuse bank arrays.

The "reload shadows" feature allows the user to force a reload of the shadow registers (including HW_OCOTP_LOCK) without having to reset the device. To force a reload, complete the following steps:

1. Check that HW_OCOTP_CTRL[BUSY] and HW_OCOTP_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write , read or reload must be completed before a new access can be requested.
2. Set the HW_OCOTP_CTRL[RELOAD_SHADOWS] bit. OCOTP will read all the fuse one by one and put it into corresponding shadow register.
3. Wait for HW_OCOTP_CTRL[BUSY] and HW_OCOTP_CTRL[RELOAD_SHADOWS] to be cleared by the controller.

The controller will automatically clear the HW_OCOTP_CTRL[RELOAD_SHADOWS] bit after the successful completion of the operation.

38.3.1.2 Fuse and Shadow Register Read

All shadow registers are always readable through the APB bus except some secret keys regions. When their corresponding fuse lock bits are set, the shadow registers also become read locked. After read locking, reading from these registers will return 0xBADABADA.

In addition HW_OCOTP_CTRL[ERROR] will be set. It must be cleared by software before any new write , read or reload access can be issued. Subsequent reads to unlocked shadow locations will still work successfully however.

To read fuse words directly from correctly complete the following steps:

1. Check that HW_OCOTP_CTRL[BUSY] and HW_OCOTP_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write, read or reload must be completed before a read access can be requested.
2. Write the requested to HW_OCOTP_CTRL[ADDR].

38.3.1.3 Fuse and Shadow Register Writes

Shadow register bits can be overridden by software until the corresponding fuse lock bit for the region is set. When the lock shadow bit is set, the shadow registers for that lock region become write locked. The LOCK shadow register also has no shadow or fuse lock bits but it is always read only.

In order to avoid "rogue" code performing erroneous writes to OTP, a special unlocking sequence is required for writes to the fuse banks. To program fuse bank correctly complete the following steps:

1. Program HW_OCOTP_TIMING[STROBE_PROG] and HW_OCOTP_TIMING[RELAX]HW_OCOTP_TIMING2[RELAX_PEOG] fields with timing values to match the current frequency of the ipg_clk. OTP writes will work at maximum bus frequencies as long as the HW_OCOTP_TIMING2 parameters are set correctly.
2. Check that HW_OCOTP_CTRL[BUSY] and HW_OCOTP_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write or reload must be completed before a write access can be requested.
3. Write the requested to HW_OCOTP_CTRL[ADDR] and program the unlock code into HW_OCOTP_CTRL[WR_UNLOCK]. This must be programmed for each write access. The lock code is documented in the register description. Both the unlock code and address can be written in the same operation.
4. Write the data to the HW_OCOTP_DATA register. This will automatically set HW_OCOTP_CTRL[BUSY] and clear HW_OCOTP_CTRL[WR_UNLOCK]. To protect programming same OTP bit twice, before program OCOTP will automatically read fuse value in OTP and use read value to mask program data. The controller will use masked program data to program a 32-bit word in the OTP per the address in HW_OCOTP_CTRL[ADDR]. Bit fields with 1's will result in that OTP bit being programmed. Bit fields with 0's will be ignored. At the same time that the write is accepted, the controller makes an internal copy of HW_OCOTP_CTRL[ADDR] which cannot be updated until the next write sequence is initiated. This copy guarantees that erroneous writes to HW_OCOTP_CTRL[ADDR] will not affect an active write operation. It should also be noted that during the programming HW_OCOTP_DATA will shift right (with zero fill). This shifting is required to program the OTP serially. During the write operation, HW_OCOTP_DATA cannot be modified.
5. Once complete, the controller will clear BUSY. A write request to a protected or locked region will result in no OTP access and no setting of HW_OCOTP_CTRL[BUSY]. In addition HW_OCOTP_CTRL[ERROR] will be set. It must be cleared by software before any new write access can be issued.

It should be noted that write latencies to OTP are numbers of 10 micro-seconds. Write latencies is based on amount of bit filed which is 1. For example : program half fuse bits in one word need 10 us x 16.

For further details of OTP read/write operations see [eFUSE].

HW_OCOTP_CTRL[ERROR] will be set under the following conditions:

- A write is performed to a shadow register during a shadow reload (essentially, while HW_OCOTP_CTRL[RELOAD_SHADOWS] is set. In addition, the contents of the shadow register shall not be updated.
- A write is performed to a shadow register which has been locked.
- A read is performed to from a shadow register which has been read locked.
- A program is performed to a fuse which has been .
- A read is performed to from a fuse which has been read locked.

38.3.1.4 Write Postamble

Due to internal electrical characteristics of the OTP during writes, all OTP operations following a write must be separated by 2 us after the clearing of HW_OCOTP_CTRL_BUSY following the write. This guarantees programming voltages on-chip to reach a steady state when exiting a write sequence. This includes reads, shadow reloads, or other writes.

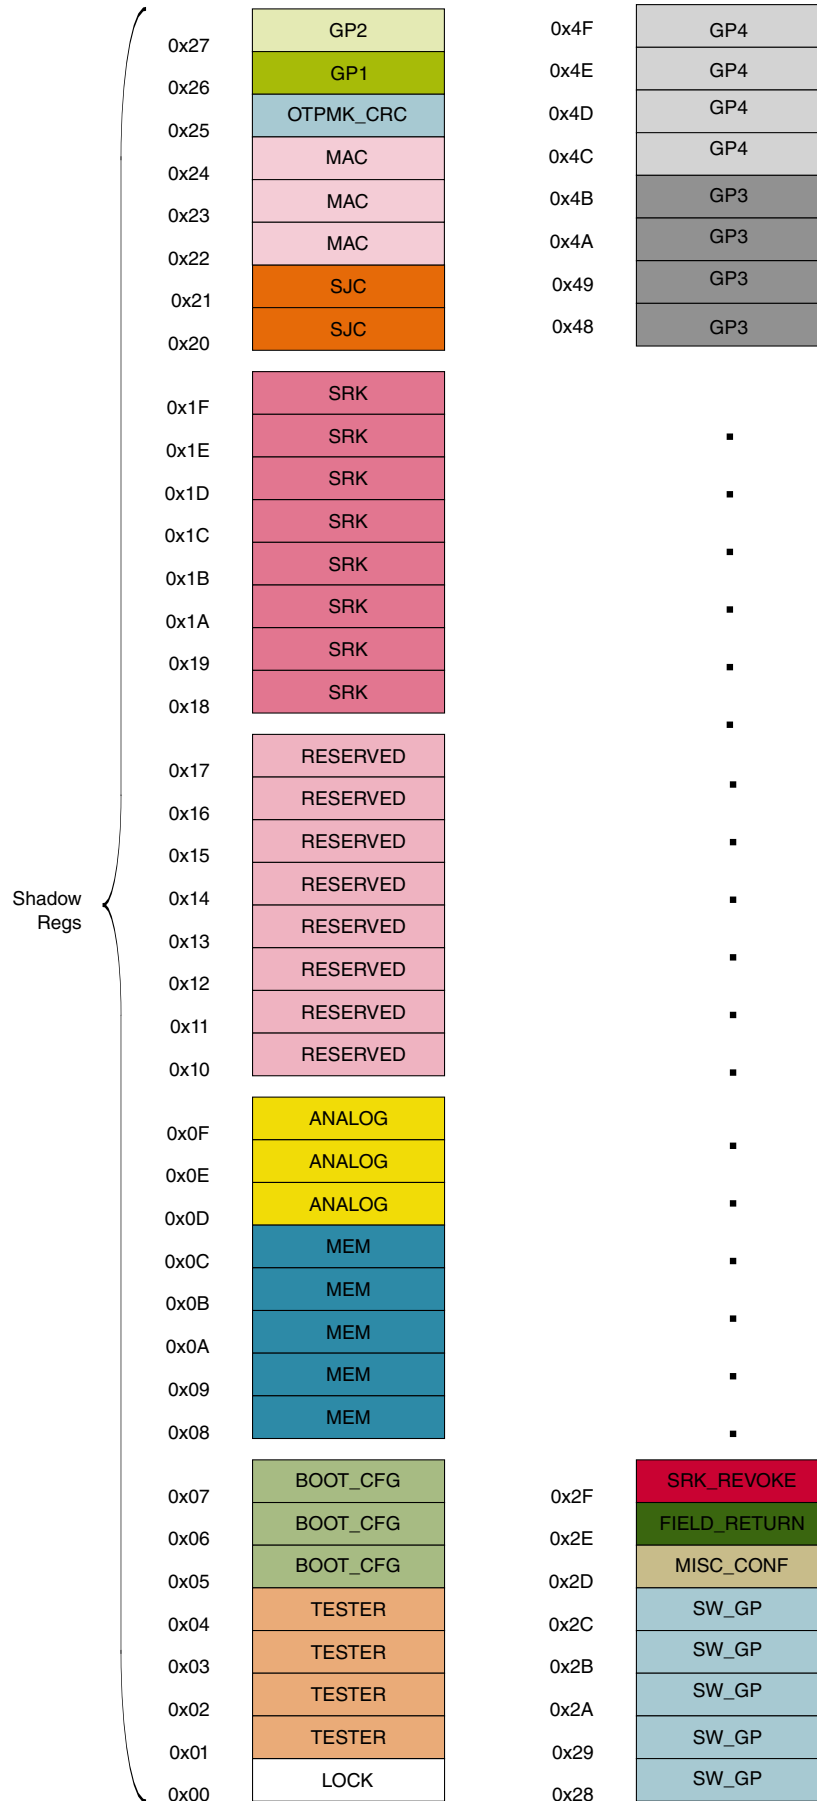

A recommended software sequence to meet the postamble requirements is as follows:

- Issue the write and poll for BUSY (as per [Fuse Shadow Memory Footprint](#)).
- Once BUSY is clear, use HW_DIGCTL_MICROSECONDS to wait 2 us.
- Perform the next OTP operation.

38.3.2 Fuse Shadow Memory Footprint

The OTP memory footprint shows in the following figure. The registers are grouped by lock region. Their names correspond to the PIO register and fusemap names.

Top-Level Symbol and Functional Overview

i.MX 6ULL Applications Processor Reference Manual, Rev. 0, 09/2016

38.3.3 OTP Read/Write Timing Parameters

There are three timing fields contained in the HW_OCOTP_TIMING and HW_OCOTP_TIMING2 register that specify counter limit values, which are used to specify the signal timing.

Both two timing parameters are specified in ipg_clk cycles. Since the ipg_clk frequency can be set to a range of values, these parameters must be adjusted with the clock to yield the appropriate delay.

38.3.4 Hardware Visible Fuses

The hmv_fuse bus emanates from the OCOTP block and goes to various other blocks inside the chip. This bus is made up of the shadow register bits for .

Only a subset of these fuse bits are currently used by the hardware. The fuse bits are initially copied from the banks after reset is deasserted. When all fuse bits are loaded into their shadow registers, the OCOTP asserts the fuse_latched output signal.

The hmv_reg bus also comes from the OCOTP. Its source is the HW_OCOTP_SCS register. This register has 1 defined bit, the HAB_JDE bit, that is connected to the SJC block. The SCS bits are intended to be used as volatile fuse bits under software control. Additional bits will be defined as needed in future implementations.

The system-wide reset sequence must be coordinated by the system reset controller, so that the hmv_fuse and hmv_reg buses are stable and reflect the values of the fuses before they are used by the rest of the system.

38.3.5 Behavior During Reset

The OCOTP is always active. The shadow registers automatically load the appropriate OTP contents after reset is deasserted. During this load-time HW_OCOTP_CTRL_BUSY is set. The load time is similar to that of a "reload shadow" operation.

38.3.6 Secure JTAG control

The JTAG control fuses are used to allow or disallow JTAG access to secured resources. Three JTAG security levels are envisioned, as shown in the table below.

Table 38-2. JTAG Security Level Control Bits

Security Mode	JTAG_SMODE	Description
No Debug	2'b11	The highest security level.
Secure JTAG	2'b01	Limit the JTAG access by using key based authentication mechanism.
JTAG Enable	2'b00	Low Security, all JTAG features are enabled.

38.4 Fuse Map

See the Fusemap chapter of this reference manual for more information.

38.5 OCOTP Memory Map/Register Definition

NOTE

When write/read unimplemented register address in `ocotp_ctrl`, `ocotp_ctrl` will not send error and read data will be 0.

OCOTP Hardware Register Format Summary

OCOTP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
21B_C000	OTP Controller Control Register (OCOTP_CTRL)	32	R/W	0000_0000h	38.5.1/2374
21B_C004	OTP Controller Control Register (OCOTP_CTRL_SET)	32	R/W	0000_0000h	38.5.1/2374
21B_C008	OTP Controller Control Register (OCOTP_CTRL_CLR)	32	R/W	0000_0000h	38.5.1/2374
21B_C00C	OTP Controller Control Register (OCOTP_CTRL_TOG)	32	R/W	0000_0000h	38.5.1/2374
21B_C010	OTP Controller Timing Register (OCOTP_TIMING)	32	R/W	02C6_4116h	38.5.2/2376
21B_C020	OTP Controller Write Data Register (OCOTP_DATA)	32	R/W	0000_0000h	38.5.3/2376
21B_C030	OTP Controller Write Data Register (OCOTP_READ_CTRL)	32	R/W	0000_0000h	38.5.4/2377
21B_C040	OTP Controller Read Data Register (OCOTP_READ_FUSE_DATA)	32	R/W	0000_0000h	38.5.5/2377
21B_C050	Sticky bit Register (OCOTP_SW_STICKY)	32	R/W	0000_0000h	38.5.6/2378
21B_C060	Software Controllable Signals Register (OCOTP_SCS)	32	R/W	0000_0000h	38.5.7/2379
21B_C064	Software Controllable Signals Register (OCOTP_SCS_SET)	32	R/W	0000_0000h	38.5.7/2379
21B_C068	Software Controllable Signals Register (OCOTP_SCS_CLR)	32	R/W	0000_0000h	38.5.7/2379

38.5.1 OTP Controller Control Register (OCOTP_CTRLn)

The OCOTP Control and Status Register specifies the copy state, as well as the control required for random access of the OTP memory

OCOTP_CTRL: 0x000

OCOTP_CTRL_SET: 0x004

OCOTP_CTRL_CLR: 0x008

OCOTP_CTRL_TOG: 0x00C

The OCOTP Control and Status Register provides the necessary software interface for performing read and write operations to the On-Chip OTP (One-Time Programmable ROM). The control fields such as WR_UNLOCK, ADDR and BUSY/ERROR may be used in conjunction with the OCOTP_DATA register to perform write operations. Read operations to the On-Chip OTP are involving ADDR, BUSY/ERROR bit field and OCOTP_READ_CTRL register. Read value is saved in OCOTP_READ_FUSE_DATA register.

Address: 21B_C000h base + 0h offset + (4d × i), where i=0d to 3d

OCOTP_CTRLn field descriptions

Field	Description
31–16 WR_UNLOCK	Write 0x3E77 to enable OTP write accesses. NOTE: This register must be unlocked on a write-by-write basis (a write is initiated when HW_OCOTP_DATA is written), so the UNLOCK bitfield must contain the correct key value during all writes to HW_OCOTP_DATA, otherwise a write shall not be initiated. This field is automatically cleared after a successful write completion (clearing of BUSY). 0x3E77 KEY — Key needed to unlock HW_OCOTP_DATA register.
15–13 RSVD1	Reserved
12 CRC_FAIL	Set by controller when calculated CRC value is not equal to appointed CRC fuse word
11 CRC_TEST	Set to calculate CRC according to start address and end address in CRC_ADDR register. And compare with CRC fuse word according CRC address in CRC_ADDR register to generate CRC_FAIL flag
10 RELOAD_SHADOWS	Set to force re-loading the shadow registers (HW/SW capability and LOCK). This operation will automatically set BUSY. Once the shadow registers have been re-loaded, BUSY and RELOAD_SHADOWS are automatically cleared by the controller.
9 ERROR	Set by the controller when an access to a locked region(OTP or shadow register) is requested. Must be cleared before any further access can be performed. This bit can only be set by the controller. This bit is also set if the Pin interface is active and software requests an access to the OTP. In this instance, the ERROR bit cannot be cleared until the Pin interface access has completed. Reset this bit by writing a one to the SCT clear address space and not by a general write.
8 BUSY	OTP controller status bit. When active, no new write access or read access to OTP(including RELOAD_SHADOWS) can be performed. Cleared by controller when access complete. After reset (or after setting RELOAD_SHADOWS), this bit is set by the controller until the HW/SW and LOCK registers are successfully copied, after which time it is automatically cleared by the controller.
7–6 RSVD0	Reserved
ADDR	OTP write and read access address register. Specifies one of 64 word address locations (0x00 - 0x3f). If a valid access is accepted by the controller, the controller makes an internal copy of this value. This internal copy will not update until the access is complete.

38.5.2 OTP Controller Timing Register (OCOTP_TIMING)

The OCOTP Data Register is used for OTP Programming

This register specifies timing parameters for programming and reading the OCOTP fuse array.

Address: 21B_C000h base + 10h offset = 21B_C010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSRVD0				WAIT				STROBE_READ				RELAX				STROBE_PROG															
W	[Shaded]																															
Reset	0	0	0	0	0	0	1	0	1	1	0	0	0	1	1	0	0	1	0	0	0	0	0	1	0	0	0	1	0	1	1	0

OCOTP_TIMING field descriptions

Field	Description
31–28 RSRVD0	These bits always read back zero.
27–22 WAIT	This count value specifies time interval between auto read and write access in one time program. It is given in number of ipg_clk periods.
21–16 STROBE_READ	This count value specifies the strobe period in one time read OTP. $Trd = ((STROBE_READ+1) - 2 * (RELAX_READ + 1)) / ipg_clk_freq$. It is given in number of IPG_CLK periods.
15–12 RELAX	This count value specifies the time to add to all default timing parameters other than the Tpgm and Trd. It is given in number of ipg_clk periods.
STROBE_PROG	This count value specifies the strobe period in one time write OTP. $Tpgm = ((STROBE_PROG+1) - 2 * (RELAX_PROG + 1)) / ipg_clk_freq$. It is given in number of ipg_clk periods.

38.5.3 OTP Controller Write Data Register (OCOTP_DATA)

The OCOTP Data Register is used for OTP Programming

This register is used in conjunction with OCOTP_CTRL to perform one-time writes to the OTP. Please see the "Software Write Sequence" section for operating details.

Address: 21B_C000h base + 20h offset = 21B_C020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DATA																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

OCOTP_DATA field descriptions

Field	Description
DATA	Used to initiate a write to OTP. Please see the "Software Write Sequence" section for operating details.

38.5.4 OTP Controller Write Data Register (OCOTP_READ_CTRL)

The OCOTP Register is used for OTP Read

This register is used in conjunction with OCOTP_CTRL to perform one time read to the OTP. Please see the "Software read Sequence" section for operating details.

Address: 21B_C000h base + 30h offset = 21B_C030h

OCOTP_READ_CTRL field descriptions

Field	Description
31–1 RSVD0	Reserved
0 READ_FUSE	Used to initiate a read to OTP. Please see the "Software read Sequence" section for operating details.

38.5.5 OTP Controller Read Data Register (OCOTP_READ_FUSE_DATA)

The OCOTP Data Register is used for OTP Read

OCOTP Memory Map/Register Definition

The data read from OTP

Address: 21B_C000h base + 40h offset = 21B_C040h

OCOTP_READ_FUSE_DATA field descriptions

Field	Description
DATA	The data read from OTP

38.5.6 Sticky bit Register (OCOTP_SW_STICKY)

Some SW sticky bits .

Some sticky bits are used by SW to lock some fuse area, shadow registers and other features.

Address: 21B_C000h base + 50h offset = 21B_C050h

OCOTP_SW_STICKY field descriptions

Field	Description
31–5 RSVD0	Reserved
4–3 -	Reserved
2 FIELD_RETURN_LOCK	Shadow register write and OTP write lock for FIELD_RETURN region. When set, the writing of this region's shadow register and OTP fuse word are blocked. Once this bit is set, it is always high unless a POR is issued.
1 SRK_REVOKE_LOCK	Shadow register write and OTP write lock for SRK_REVOKE region. When set, the writing of this region's shadow register and OTP fuse word are blocked. Once this bit is set, it is always high unless a POR is issued.
0 -	Reserved

38.5.7 Software Controllable Signals Register (OCOTP_SCSn)

OCOTP_SCS: 0x060

OCOTP_SCS_SET: 0x064

OCOTP_SCS_CLR: 0x068

OCOTP_SCS_TOG: 0x06C

This register holds volatile configuration values that can be set and locked by trusted software. All values are returned to their default values after POR.

OCOTP Memory Map/Register Definition

Address: 21B_C000h base + 60h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	<div style="display: flex; justify-content: space-between;"> LOCK SPARE </div>															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

OCOTP_SCSn field descriptions

Field	Description
31 LOCK	When set, all of the bits in this register are locked and can not be changed through SW programming. This bit is only reset after a POR is issued.
30–1 SPARE	Unallocated read/write bits for implementation specific software use.
0 HAB_JDE	<p>HAB JTAG Debug Enable. This bit is used by the HAB to enable JTAG debugging, assuming that a properlay signed command to do so is found and validated by the HAB.</p> <p>The HAB must lock the register before passing control to the OS whether or not JTAG debugging has been enabled.</p> <p>Once JTAG is enabled by this bit, it can not be disabled unless the system is reset by POR. 0: JTAG debugging is not enabled by the HAB (it may still be enabled by other mechanisms).</p> <p>1: JTAG debugging is enabled by the HAB (though this signal may be gated off).</p>

38.5.8 OTP Controller CRC test address (OCOTP_CRC_ADDR)

The OCOTP Data Register is used for OTP Read

The address for CRC calculation

Address: 21B_C000h base + 70h offset = 21B_C070h

OCOTP_CRC_ADDR field descriptions

Field	Description
31–20 RSVD0	Reserved
19 OTPMK_CRC	Enable bit for CRC32 calculation address When OTPMK_CRC_ADDR_OTPMK_CRC bit sets to 1, calculation address sets to OTPMK_CRC (recommend).
18–16 CRC_ADDR	Address of 32-bit CRC result for comparing
15–8 DATA_END_ADDR	Start address of fuse location for CRC calculation
DATA_START_ADDR	End address of fuse location for CRC calculation

38.5.9 OTP Controller CRC Value Register (OCOTP_CRC_VALUE)

The OCOTP Data Register is used for OTP Read

OCOTP Memory Map/Register Definition

The CRC32 value is based on CRC_ADDR.

Address: 21B_C000h base + 80h offset = 21B_C080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OCOTP_CRC_VALUE field descriptions

Field	Description
DATA	The crc32 value based on CRC_ADDR

38.5.10 OTP Controller Version Register (OCOTP_VERSION)

This register always returns a known read value for debug purposes it indicates the version of the block.

This register indicates the RTL version in use.

Address: 21B_C000h base + 90h offset = 21B_C090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OCOTP_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

38.5.11 OTP Controller Timing Register 2 (OCOTP_TIMING2)

Address: 21B_C000h base + 100h offset = 21B_C100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OCOTP_TIMING2 field descriptions

Field	Description
31–29 Reserved	This field is reserved.
28–22 RELAX1	Not used, preserved
21–16 RELAX_READ	This count value specifies the time to add to read OTP for complement address enable cycle time.
15–12 Reserved	This field is reserved.
RELAX_PROG	This count value specifies the time to add to write OTP for complement address enable time.

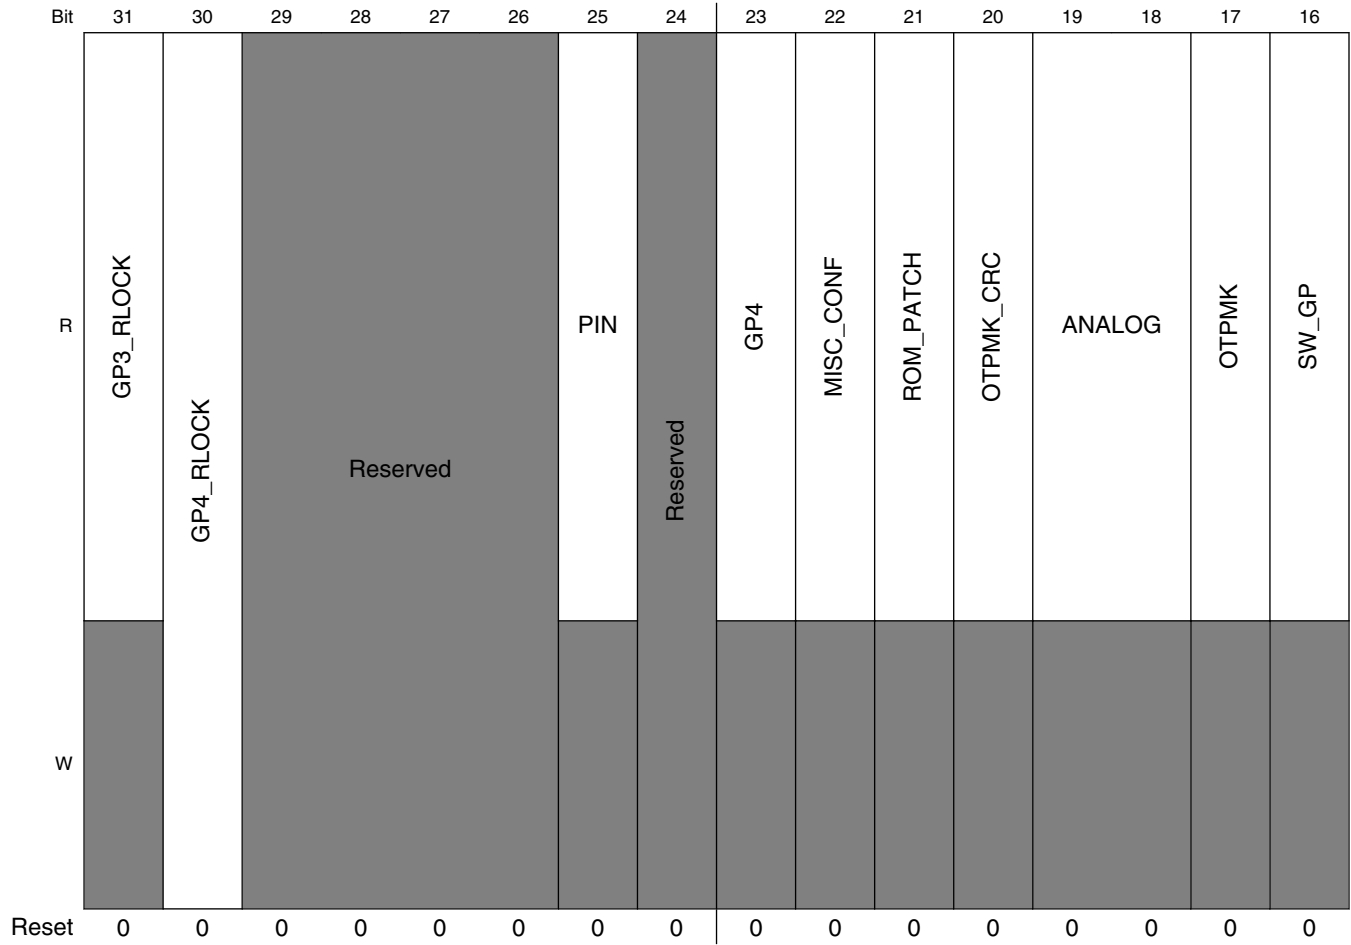

38.5.12 Value of OTP Bank0 Word0 (Lock controls) (OCOTP_LOCK)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 0, word 0 (ADDR = 0x00).

OCOTP Memory Map/Register Definition

Address: 21B_C000h base + 400h offset = 21B_C400h

OCOTP_LOCK field descriptions

Field	Description
31 GP3_RLOCK	Status of shadow register and OTP read lock for GP3 region. When set, the reading of this region's shadow register and OTP fuse word are blocked.
30 GP4_RLOCK	Status of shadow register and OTP read lock for GP4 region. When set, the reading of this region's shadow register and OTP fuse word are blocked.
29–26 Reserved	This field is reserved.
25 PIN	Status of Pin access lock bit. When set, pin access is disabled.
24 Reserved	This field is reserved.
23 GP4	Status of shadow register and OTP write lock for GP4 region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
22 MISC_CONF	Status of shadow register and OTP write lock for misc_conf region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
21 ROM_PATCH	Status of shadow register and OTP write lock for rom_patch region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
20 OTPMK_CRC	Status of shadow register and OTP write lock for otpmk_crc region. When set, the writing of this region's shadow register and OTP fuse word are blocked.

Table continues on the next page...

OCOTP_LOCK field descriptions (continued)

Field	Description
19–18 ANALOG	Status of shadow register and OTP write lock for analog region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
17 OTPMK	Status of shadow register and OTP write lock for OTPMK region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
16 SW_GP	Status of shadow register and OTP write lock for SW_GP region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
15 GP3	Status of shadow register and OTP write lock for GP3 region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
14 SRK	Status of shadow register and OTP write lock for srk region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
13–12 GP2	Status of shadow register and OTP write lock for gp2 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
11–10 GP1	Status of shadow register and OTP write lock for gp2 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
9–8 MAC_ADDR	Status of shadow register and OTP write lock for mac_addr region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
7 RSVD0	Reserved
6 SJC_RESP	Status of shadow register read and write, OTP read and write lock for sjc_resp region. When set, the writing of this region's shadow register and OTP fuse word are blocked. The read of this region's shadow register and OTP fuse word are also blocked.
5–4 MEM_TRIM	Status of shadow register and OTP write lock for mem_trim region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
3–2 BOOT_CFG	Status of shadow register and OTP write lock for boot_cfg region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
TESTER	Status of shadow register and OTP write lock for tester region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.

38.5.13 Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (OCOTP_CFG0)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 0, word 1 (ADDR = 0x01).

Address: 21B_C000h base + 410h offset = 21B_C410h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OCOTP_CFG0 field descriptions

Field	Description
BITS	This register contains 32 bits of the Unique ID and SJC_CHALLENGE field. Reflects value of OTP Bank 0, word 1 (ADDR = 0x01). These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

38.5.14 Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (OCOTP_CFG1)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 0, word 2 (ADDR = 0x02).

Address: 21B_C000h base + 420h offset = 21B_C420h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OCOTP_CFG2 field descriptions

Field	Description
BITS	Reflects value of OTP Bank 0, word 3 (ADDR = 0x03). These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

38.5.16 Value of OTP Bank0 Word4 (Configuration and Manufacturing Info.) (OCOTP_CFG3)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Non-shadowed memory mapped access to OTP Bank 0, word 4 (ADDR = 0x04).

Address: 21B_C000h base + 440h offset = 21B_C440h

OCOTP_CFG3 field descriptions

Field	Description
BITS	Reflects value of OTP Bank 0, word 4 (ADDR = 0x04). These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

38.5.17 Value of OTP Bank0 Word5 (Configuration and Manufacturing Info.) (OCOTP_CFG4)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 0, word 5 (ADDR = 0x05).

Address: 21B_C000h base + 450h offset = 21B_C450h

OCOTP_CFG4 field descriptions

Field	Description
BITS	Reflects value of OTP Bank 0, word 5 (ADDR = 0x05). These bits become read-only after the HW_OCOTP_LOCK_BOOT_CFG[1] bit is set.

38.5.18 Value of OTP Bank0 Word6 (Configuration and Manufacturing Info.) (OCOTP_CFG5)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 0, word 6 (ADDR = 0x06).

Address: 21B_C000h base + 460h offset = 21B_C460h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OCOTP_CFG6 field descriptions

Field	Description
BITS	Reflects value of OTP Bank 0, word 7 (ADDR = 0x07). These bits become read-only after the HW_OCOTP_LOCK_BOOT_CFG[1] bit is set.

38.5.20 Value of OTP Bank1 Word0 (Memory Related Info.) (OCOTP_MEM0)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 1, word 0 (ADDR = 0x08).

Address: 21B_C000h base + 480h offset = 21B_C480h

OCOTP_MEM0 field descriptions

Field	Description
BITS	Reflects value of OTP bank 1, word 0 (ADDR = 0x08). These bits become read-only after the HW_OCOTP_LOCK_MEM_TRIM[1] bit is set.

38.5.21 Value of OTP Bank1 Word1 (Memory Related Info.) (OCOTP_MEM1)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 1, word 1 (ADDR = 0x09).

Address: 21B_C000h base + 490h offset = 21B_C490h

OCOTP_MEM1 field descriptions

Field	Description
BITS	Reflects value of OTP bank 1, word 1 (ADDR = 0x09). These bits become read-only after the HW_OCOTP_LOCK_MEM_TRIM[1] bit is set.

38.5.22 Value of OTP Bank1 Word2 (Memory Related Info.) (OCOTP_MEM2)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 1, word 2 (ADDR = 0x0A).

Address: 21B_C000h base + 4A0h offset = 21B_C4A0h

OCOTP_MEM2 field descriptions

Field	Description
BITS	Reflects value of OTP bank 1, word 2 (ADDR = 0x0A). These bits become read-only after the HW_OCOTP_LOCK_MEM_TRIM[1] bit is set.

38.5.23 Value of OTP Bank1 Word3 (Memory Related Info.) (OCOTP_MEM3)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 1, word 3 (ADDR = 0x0B).

Address: 21B_C000h base + 4B0h offset = 21B_C4B0h

OCOTP_MEM3 field descriptions

Field	Description
BITS	Reflects value of OTP bank 1, word 3 (ADDR = 0x0B). These bits become read-only after the HW_OCOTP_LOCK_MEM_TRIM[1] bit is set.

38.5.24 Value of OTP Bank1 Word4 (Memory Related Info.) (OCOTP_MEM4)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 1, word 4 (ADDR = 0x0C).

Address: 21B_C000h base + 4C0h offset = 21B_C4C0h

OCOTP_MEM4 field descriptions

Field	Description
BITS	Reflects value of OTP bank 1, word 4 (ADDR = 0x0C). These bits become read-only after the HW_OCOTP_LOCK_MEM_TRIM[1] bit is set.

38.5.25 Value of OTP Bank1 Word5 (Memory Related Info.) (OCOTP_ANA0)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 1, word 5 (ADDR = 0x0D).

Address: 21B_C000h base + 4D0h offset = 21B_C4D0h

OCOTP_ANA0 field descriptions

Field	Description
BITS	Reflects value of OTP bank 1, word 5 (ADDR = 0x0D). These bits become read-only after the HW_OCOTP_LOCK_ANALOG[1] bit is set.

38.5.26 Value of OTP Bank1 Word6 (General Purpose Customer Defined Info.) (OCOTP_ANA1)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 1, word 6 (ADDR = 0x0E).

Address: 21B_C000h base + 4E0h offset = 21B_C4E0h

OCOTP_ANA1 field descriptions

Field	Description
BITS	Reflects value of OTP bank 1, word 6 (ADDR = 0x0E). These bits become read-only after the HW_OCOTP_LOCK_ANALOG[1] bit is set.

38.5.27 Value of OTP Bank1 Word7 (General Purpose Customer Defined Info.) (OCOTP_ANA2)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 1, word 7 (ADDR = 0x0F).

Address: 21B_C000h base + 4F0h offset = 21B_C4F0h

OCOTP_ANA2 field descriptions

Field	Description
BITS	Reflects value of OTP bank 1, word 7 (ADDR = 0x0F). These bits become read-only after the HW_OCOTP_LOCK_ANALOG[1] bit is set.

38.5.28 Value of OTP Bank2 Word0 (OTPMK Key) (OCOTP_OTPMK0)

Shadow register for the OTPMK Key word0 (Copy of OTP Bank 2, word 0 (ADDR = 0x10)). These bits can not be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

Address: 21B_C000h base + 500h offset = 21B_C500h

OCOTP_OTPMK0 field descriptions

Field	Description
BITS	Shadow register for the OTPMK Key word0 (Copy of OTP Bank 2, word 0 (ADDR = 0x10)). These bits can not be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

38.5.29 Value of OTP Bank2 Word1 (OTPMK Key) (OCOTP_OTPMK1)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 2, word 1 (ADDR = 0x11).

Address: 21B_C000h base + 510h offset = 21B_C510h

OCOTP_OTPMK1 field descriptions

Field	Description
BITS	Shadow register for the OTPMK Key word0 (Copy of OTP Bank 2, word 1 (ADDR = 0x11)). These bits can not be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

38.5.30 Value of OTP Bank2 Word2 (OTPMK Key) (OCOTP_OTPMK2)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 2, word 2 (ADDR = 0x12).

Address: 21B_C000h base + 520h offset = 21B_C520h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OCOTP_OTPMK3 field descriptions

Field	Description
BITS	Shadow register for the OTPMK Key word0 (Copy of OTP Bank 2, word 3 (ADDR = 0x13)). These bits can not be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

38.5.32 Value of OTP Bank2 Word4 (OTPMK Key) (OCOTP_OTPMK4)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 2, word 4 (ADDR = 0x14).

Address: 21B_C000h base + 540h offset = 21B_C540h

OCOTP_OTPMK4 field descriptions

Field	Description
BITS	Shadow register for the OTPMK Key word0 (Copy of OTP Bank 2, word 4 (ADDR = 0x14)). These bits can not be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

38.5.33 Value of OTP Bank2 Word5 (OTPMK Key) (OCOTP_OTPMK5)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 2, word 5 (ADDR = 0x15).

Address: 21B_C000h base + 550h offset = 21B_C550h

OCOTP_OTPMK5 field descriptions

Field	Description
BITS	Shadow register for the OTPMK Key word0 (Copy of OTP Bank 2, word 4 (ADDR = 0x14)). These bits can not be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

38.5.34 Value of OTP Bank2 Word6 (OTPMK Key) (OCOTP_OTPMK6)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 2, word 6 (ADDR = 0x16).

Address: 21B_C000h base + 560h offset = 21B_C560h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OCOTP_OTPMK7 field descriptions

Field	Description
BITS	Shadow register for the OTPMK Key word0 (Copy of OTP Bank 2, word 7 (ADDR = 0x17)). These bits can not be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

38.5.36 Shadow Register for OTP Bank3 Word0 (SRK Hash) (OCOTP_SRK0)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS].

Shadowed memory mapped access to OTP Bank 3, word 0 (ADDR = 0x18).

Address: 21B_C000h base + 580h offset = 21B_C580h

OCOTP_SRK0 field descriptions

Field	Description
BITS	Shadow register for the hash of the Super Root Key word0 (Copy of OTP Bank 3, word 0 (ADDR = 0x18)). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

38.5.37 Shadow Register for OTP Bank3 Word1 (SRK Hash) (OCOTP_SRK1)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS].

Shadowed memory mapped access to OTP Bank 3, word 1 (ADDR = 0x19).

Address: 21B_C000h base + 590h offset = 21B_C590h

OCOTP_SRK1 field descriptions

Field	Description
BITS	Shadow register for the hash of the Super Root Key word1 (Copy of OTP Bank 3, word 1 (ADDR = 0x19)). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

38.5.38 Shadow Register for OTP Bank3 Word2 (SRK Hash) (OCOTP_SRK2)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS].

Shadowed memory mapped access to OTP Bank 3, word 2 (ADDR = 0x1A).

Address: 21B_C000h base + 5A0h offset = 21B_C5A0h

OCOTP_SRK2 field descriptions

Field	Description
BITS	Shadow register for the hash of the Super Root Key word2 (Copy of OTP Bank 3, word 2 (ADDR = 0x1A)). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

38.5.39 Shadow Register for OTP Bank3 Word3 (SRK Hash) (OCOTP_SRK3)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS].

Shadowed memory mapped access to OTP Bank 3, word 3 (ADDR = 0x1B).

Address: 21B_C000h base + 5B0h offset = 21B_C5B0h

OCOTP_SRK3 field descriptions

Field	Description
BITS	Shadow register for the hash of the Super Root Key word3 (Copy of OTP Bank 3, word 3 (ADDR = 0x1B)). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

38.5.40 Shadow Register for OTP Bank3 Word4 (SRK Hash) (OCOTP_SRK4)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS].

Shadowed memory mapped access to OTP Bank 3, word 4 (ADDR = 0x1C).

Address: 21B_C000h base + 5C0h offset = 21B_C5C0h

OCOTP_SRK4 field descriptions

Field	Description
BITS	Shadow register for the hash of the Super Root Key word4 (Copy of OTP Bank 3, word 4 (ADDR = 0x1C)). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

38.5.41 Shadow Register for OTP Bank3 Word5 (SRK Hash) (OCOTP_SRK5)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS].

Shadowed memory mapped access to OTP Bank 3, word 5 (ADDR = 0x1D).

Address: 21B_C000h base + 5D0h offset = 21B_C5D0h

OCOTP_SRK5 field descriptions

Field	Description
BITS	Shadow register for the hash of the Super Root Key word5 (Copy of OTP Bank 3, word 5 (ADDR = 0x1D)). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

38.5.42 Shadow Register for OTP Bank3 Word6 (SRK Hash) (OCOTP_SRK6)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS].

Shadowed memory mapped access to OTP Bank 3, word 6 (ADDR = 0x1E).

Address: 21B_C000h base + 5E0h offset = 21B_C5E0h

OCOTP_SRK6 field descriptions

Field	Description
BITS	Shadow register for the hash of the Super Root Key word6 (Copy of OTP Bank 3, word 6 (ADDR = 0x1E)). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

38.5.43 Shadow Register for OTP Bank3 Word7 (SRK Hash) (OCOTP_SRK7)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS].

Shadowed memory mapped access to OTP Bank 3, word 7 (ADDR = 0x1F).

Address: 21B_C000h base + 5F0h offset = 21B_C5F0h

OCOTP_SRK7 field descriptions

Field	Description
BITS	Shadow register for the hash of the Super Root Key word7 (Copy of OTP Bank 3, word 7 (ADDR = 0x1F)). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

38.5.44 Value of OTP Bank4 Word0 (Secure JTAG Response Field) (OCOTP_SJC_RESP0)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 4, word 0 (ADDR = 0x20).

Address: 21B_C000h base + 600h offset = 21B_C600h

OCOTP_SJC_RESP0 field descriptions

Field	Description
BITS	Shadow register for the SJC_RESP Key word0 (Copy of OTP Bank 4, word 0 (ADDR = 0x20)). These bits can be not read and written after the HW_OCOTP_LOCK_SJC_RESP bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

38.5.45 Value of OTP Bank4 Word1 (Secure JTAG Response Field) (OCOTP_SJC_RESP1)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 4, word 1 (ADDR = 0x21).

Address: 21B_C000h base + 610h offset = 21B_C610h

OCOTP_SJC_RESP1 field descriptions

Field	Description
BITS	Shadow register for the SJC_RESP Key word1 (Copy of OTP Bank 4, word 1 (ADDR = 0x21)). These bits can be not read and written after the HW_OCOTP_LOCK_SJC_RESP bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

38.5.46 Value of OTP Bank4 Word2 (MAC Address) (OCOTP_MAC0)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 4, word 2 (ADDR = 0x22).

Address: 21B_C000h base + 620h offset = 21B_C620h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Chapter 39

On-Chip RAM Memory Controller (OCRAM)

39.1 Overview

There is 1 OCRAM controller implemented in i.MX 6ULL. One controller is for the 128KB on-chip RAM.

The on-chip RAM block is implemented as a slave module on the 64-bit system AXI bus. Designed as a simple on-chip memory controller, it supports only one AXI port with memory banks. For the AXI port, the read and write transactions are handled by two independent modules. As it is possible to have simultaneous read and write requests from the AXI bus, each memory bank has an arbiter with a round-robin scheme. After arbitration, the granted read or write access command can then be issued to the memory cell through a read/write MUX.

The 4 memory banks are organized with the lower 2 bits of the address which is the AXI bus address and is 64 bits aligned interleaved. This allows a read access and a write access to be processed at the same time if they are targeted to different memory banks.

Various options are provided for adding a pipeline or wait-states in a read/write access, in order to ensure flexible timing control at both high and low frequencies.

The internal block diagram is shown in the figure below.

Figure 39-1. On-chip RAM Block Diagram

39.2 Basic Functions

39.2.1 Read/Write Arbitration

The detailed rules used in arbitration are as follows:

- If there is no granted read or write in the last cycle, and there is only a read request or a write request, the request will be granted.
- If there is no granted read or write in the last cycle, and there are both read or write requests coming in at the same time, the read request will be granted first.

- If a granted read/write transaction has just finished, the write/read request will have the higher priority in the next cycle.
- If the first read/write access request in a transaction is granted, all the data transfer in this burst will be finished before the next arbitration begins, that is, the round-robin arbitration mechanism is based on AXI transaction, not data access.

39.3 Advanced Features

This section describes some advanced features designed to avoid timing issues when the on-chip RAM is working at high frequency.

All of the features can be disabled/enabled by programming the corresponding fields of the General Purpose Register (IOMUXC.GPR3) bits [24:21] and bits [3:0] in the IOMUX chapter.

39.3.1 Read Data Wait State

When the wait state is enabled, it will take 2 cycles for each read access (each beat of a read burst).

This can avoid the potential timing problem caused by the longer memory access time at higher frequency.

When this feature is disabled, it only takes 1 clock cycle to finish a read transaction. That is, read data is available in the next cycle of read request becomes valid on the bus.

For the normal OCRAM, the read data wait state is configurable via IOMUXC.GPR3[21]. For the L2 cache as OCRAM, the read data wait state is configurable via IOMUXC.GPR3[0].

39.3.2 Read Address Pipeline

When this feature is enabled, the read address from the AXI master is delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issues for the read access on the memory cell at high frequency. Enabling this feature can cost, at most, 1 more clock cycle for each AXI read transaction, that is, at most 1 more clock cycle for each read burst with multiple beats of data.

When this feature is disabled, the read address from the AXI master can be accepted by the on-chip RAM without delay, and data can become ready for master at next clock cycle (if no other access and no read data wait).

For the normal OCRAM, the read address pipeline is configurable via IOMUXC.GPR3[22]. For the L2 cache as OCRAM, the read address pipeline is configurable via IOMUXC.GPR3[1].

39.3.3 Write Data Pipeline

When this feature is enabled, the write data from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issue for the write access on the memory cell at high frequency. Enabling this feature would cost at most 1 more clock cycle for each AXI write transaction, that is, at most 1 more clock cycle for each write burst with multiple beats of data.

When this feature is disabled, the write data from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write address is also ready at this cycle).

For the normal OCRAM, the write data pipeline is configurable via IOMUXC.GPR3[23]. For the L2 cache as OCRAM, the write data pipeline is configurable via IOMUXC.GPR3[2].

39.3.4 Write Address Pipeline

When this feature is enabled, the write address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issue for the write access on the memory cell at high frequency. Enabling this feature would take at most 1 more clock cycle for each AXI write transaction, that is, at most 1 more clock cycle for each write burst with multiple beats of data.

When this feature is disabled, the write address from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write data is also ready at this cycle).

For the normal OCRAM, the write address pipeline is configurable via IOMUXC.GPR3[24]. For the L2 cache as OCRAM, the write address pipeline is configurable via IOMUXC.GPR3[3].

39.4 Programmable Registers

There are no programmable registers in this block; however, OCRAM configurable bits can be found in the IOMUX Controller (IOMUXC) general purpose registers found here.

- TrustZone bits: IOMUXC_GPR10
- WAIT state / Pipeline bits: IOMUXC_GPR3

Chapter 40

Power Management Unit (PMU)

40.1 Overview

The power management unit (PMU) is designed to simplify the external power interface. The power system can be split into the input power sources and their characteristics, the integrated power transforming and controlling elements, and the final load interconnection and requirements.

A typical power system uses the PMU is depicted in the following diagram.

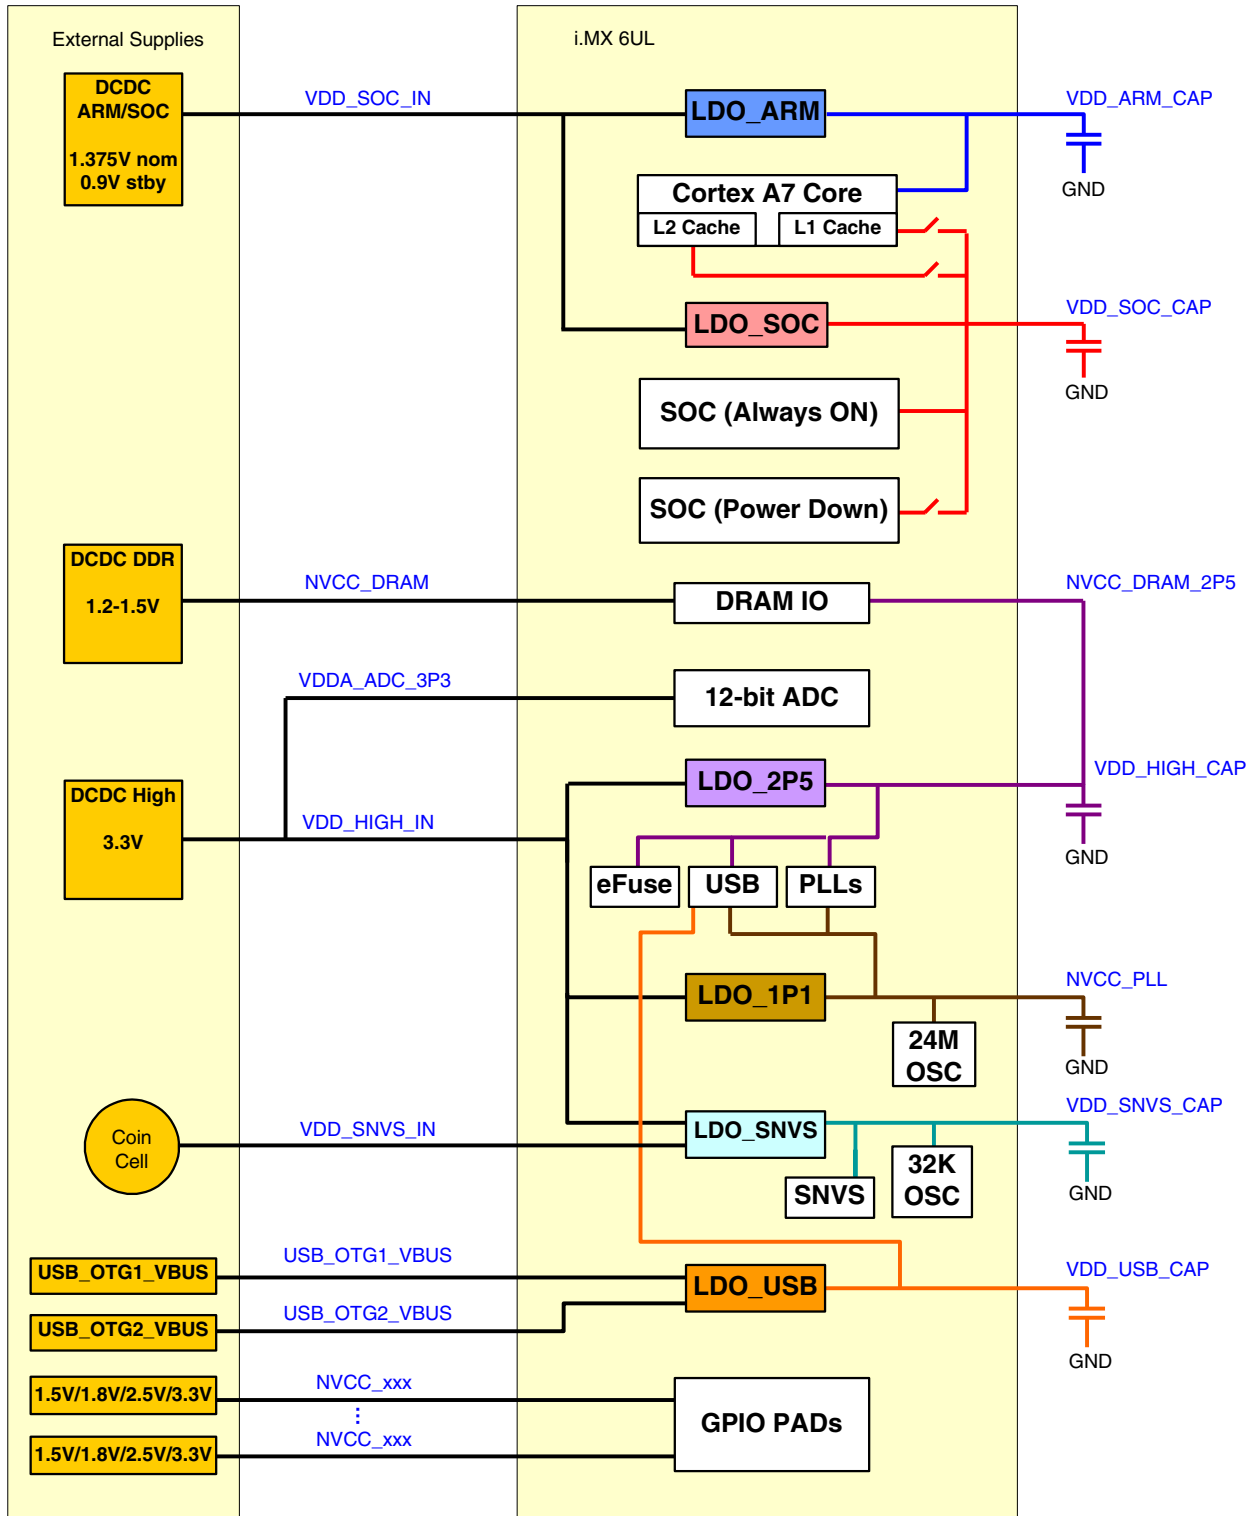

Figure 40-1. Power system overview

Using seven LDO regulators, the number of external supplies is greatly reduced. Not counting the backup coin and USB inputs, the number of external supplies is reduced to two. Missing from this external supply total is the number of necessary external supplies to power the desired memory interface; that number varies depending on the type of external memory selected. Other supplies may also be necessary to supply the voltage to the different I/O power segments if their I/O voltages have to be different from what is provided above.

40.2 Digital LDO Regulators

The PMU has three digital LDO regulators. They are referred to as "digital" because of the logic loads they drive, not because of their construction. These regulators have three basic modes that are unique to the digital regulators.

- **Power Gate**—The regulation FET is switched off fully, limiting the current draw from the supply. The analog part of the regulator is powered down, limiting the power consumption. The output voltage falls to a level at which the residual leakage of the power FET balances with the leakage of the load. (TARG = 0x00)
- **Analog regulation mode**—The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25mV steps.

These modes allow the regulators to implement voltage scaling and power gating and allow bypass. With the bypass feature, all of the accuracy and control requirements can be shifted to the external supply source if capable and desired.

These digital regulators also feature brownout detection which is helpful when supplies are starting to collapse. The voltage value where brownout is signaled is programmable as an offset from the programmed target voltage. The controls are located in the PMU_MISC2 register. The core is interrupted on a brownout.

The two digital regulators are known as LDO_ARM, , and LDO_SOC. As shown in the power system overview figure, the ARM regulator powers the ARM cores. All regulators support generous programming ranges in 25mV steps. It is possible to program voltages above the process limit for the chip, thus causing permanent damage. Likewise, it is possible to program the voltage so low that the chip cannot continue to operate or even retain state without clocks. Care should be taken with these settings.

Care must be taken when raising the output voltage of the regulator rapidly. This can cause large currents to flow into the output cap of the regulator up to the limits of the input supply. When the input supply capability is exceeded, this can cause an input supply dip that may affect other regulators on the same supply. Therefore, the rate of

voltage change on the output of the regulator should be limited. When powering up the regulator, the integrated current limiter controls the ramp rate. This limiter is only effective when transitioning from the off state of the regulator (bypassed or power gated).

However, in a DVFS situation, the same high rate of change can occur if the target voltage is raised rapidly by software. To limit the rate of change, the hardware controlling the regulator effects a piecewise linear ramp by stepping the output voltage in 25mV steps until the desired output voltage is reached. The slope of the ramp is controlled by the time spent at each 25mV step and is controlled by the step time field in the PMU_MISC2 register. The same situation is not a problem when the output voltage is dropped as the load pulls down the output cap. As a result, any reduction in the programmed regulator target voltage is immediately effective with the actual supply voltage falling at a rate controlled by the load on the regulator.

40.3 Analog LDO Regulators

There are two analog regulators described here.

40.3.1 LDO 1P1

The LDO_1P1 module on the chip implements a programmable linear-regulator function from a higher analog supply voltage (2.8 V–3.3 V) to produce a nominal 1.1 V output voltage.

The output of the regulator can be programmed in 25 mV steps from 0.8 V to 1.4 V. The regulator has been designed to be stable with a minimum external low-ESR decoupling capacitance, though the actual capacitance required should be determined by the application. A programmable brownout detector is included in the regulator which can be used by the system to determine when the load capability of the regulator is being exceeded, so the necessary steps can be taken.

Current limiting can be enabled by setting the PMU_REG_1P1[ENABLE_ILIMIT] bit to allow for in-rush current requirements during startup if needed. Active pulldown can also be enabled by setting the PMU_REG_1P1[ENABLE_PULLDOWN] bit for systems requiring this feature.

40.3.2 LDO 2P5

The LDO_2P5 module on the chip implements a programmable linear-regulator function from a higher analog supply voltage (2.8V-3.3V) to produce a nominal 2.5V output voltage.

The output of the regulator can be programmed in 25mV steps from 2.0V to 2.75V. The regulator has been designed to be stable with a minimum external low-ESR decoupling capacitance, though the actual capacitance required should be determined by the application. A programmable brown-out detector is included in the regulator which can be used by the system to determine when the load capability of the regulator is being exceeded to take the necessary steps.

Current-limiting can be enabled by setting the REG_PMU_2P5[ENABLE_ILIMIT] bit to allow for in-rush current requirements during start-up if needed. Active-pulldown can also be enabled by setting the REG_PMU_2P5[ENABLE_PULLDOWN] bit for systems requiring this feature.

40.3.3 Low Power Operation

The 1.1 V and 2.5 V LDO includes an alternate, self-biased, low-precision, weak regulator which can be enabled for applications needing to keep the 1.1 V and 2.5 V output voltage alive during low-power modes where the main regulator and its associated global bandgap reference module are disabled.

The output of this weak regulator is not programmable and is a function of its input power supply as well as load current. The low-power mode is enabled by setting high the PMU_REG_1P1[ENABLE_WEAK_LINREG] and PMU_REG_2P5[ENABLE_WEAK_LINREG] bit of the regulator. It is recommended that the following sequence be followed to enable this mode:

1. Throttle down the 1.1 V / 2.5 V attached load to its low-power maintain state.
2. Disable the main 1.1 V / 2.5 V regulator driver by clearing the PMU_REG_1P1[ENABLE_LINREG] / PMU_REG_2P5[ENABLE_LINREG] bit.
3. Enable the weak 1.1 V / 2.5 V regulator by setting the PMU_REG_1P1[ENABLE_WEAK_LINREG] / PMU_REG_2P5[ENABLE_WEAK_LINREG] bit.

To go back to full-power operation, reverse the steps outlined above. Note that the external decoupling cap is supporting the power supply between steps 2 and 3. Therefore step 3 should happen appropriately in time relative to the discharge of the supporting capacitor.

40.4 USB LDO Regulator

The USB_LDO module on the chip implements a programmable linear-regulator function from the USB VBUS voltages (typically 5 V) to produce a nominal 3.0 V output voltage.

The output of the regulator can be programmed in 25 mV steps, from 2.625V to 3.4 V . The regulator has been designed to be stable with a minimum external low-ESR decoupling capacitor of 4.7 μ F, though the actual capacitance required should be determined by the application. A programmable brownout detector is included in the regulator which can be used by the system to determine when the load capability of the regulator is being exceeded, so the necessary steps can be taken. This regulator has a built-in power mux which allows the user to choose to run the regulator from either VBUS supply when both are present. If only one of the VBUS voltages is present, then the regulator automatically selects this supply. Current limit is also included to help the system meet in-rush current targets.

Upon attachment of VBUS, this regulator starts up in a low-power, self-preservation mode to prevent over-voltage conditions on the chip. It is expected that the user transition to full regulation by enabling the regulator and disabling the in-rush current limits via its control registers. Upon VBUS removal, it is further expected that the regulator controls are returned to their reset state.

40.5 SNVS Regulator

The SNVS regulator takes the SNVS_IN supply and generates the SNVS_CAP supply, which powers the real time clock and SNVS blocks.

If VDDHIGH_IN is present, then the SNVS_IN supply is internally shorted to the VDDHIGH_IN supply to allow coin cell recharging if necessary. The output voltage is roughly one third of SNVS_IN.

40.6 PMU Memory Map/Register Definition

The register definitions that affect the behavior of the digital LDO regulators follow.

NOTE

Some of the registers are collections of bits that affect multiple components on the chip. Those that are not pertinent to this chapter have comments in the related register bitfields.

If a full description is desired, please consult the full register programming reference in the related block.

40.6.1 Regulator 1P1 Register (PMU_REG_1P1)

This register defines the control and status bits for the 1.1V regulator. This regulator is designed to power the digital portions of the analog cells.

Address: 20C_8000h base + 110h offset = 20C_8110h

PMU_REG_1P1 field descriptions

Field	Description
31–20 -	This field is reserved.
19 SELREF_ WEAK_LINREG	Selects the source for the reference voltage of the weak 1p1 regulator. 0 Weak-linreg output tracks low-power-bandgap voltage 1 Weak-linreg output tracks VDD_SOC_CAP voltage
18 ENABLE_ WEAK_LINREG	Enables the weak 1p1 regulator. This regulator can be used when the main 1p1 regulator is disabled, under low-power conditions.
17 OK_VDD1P1	Status bit that signals when the regulator output is ok. 1 = regulator output > brownout target
16 BO_VDD1P1	Status bit that signals when a brownout is detected on the regulator output.
15–13 -	This field is reserved.
12–8 OUTPUT_TRG	Control bits to adjust the regulator output voltage. Each LSB is worth 25mV. Programming examples are detailed below. Other output target voltages may be interpolated from these examples. Choices must be in this range: 0x1b >= output_trg >= 0x04 NOTE: There may be reduced chip functionality or reliability at the extremes of the programming range. 0x04 0.8V 0x10 1.1V 0x1b 1.375V
7 -	This field is reserved.

Table continues on the next page...

PMU_REG_1P1 field descriptions (continued)

Field	Description
6-4 BO_OFFSET	Control bits to adjust the regulator brownout offset voltage in 25mV steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.
3 ENABLE_PULLDOWN	Control bit to enable the pull-down circuitry in the regulator
2 ENABLE_ILIMIT	Control bit to enable the current-limit circuitry in the regulator.
1 ENABLE_BO	Control bit to enable the brownout circuitry in the regulator.
0 ENABLE_LINREG	Control bit to enable the regulator output.

40.6.2 Regulator 3P0 Register (PMU_REG_3P0)

This register defines the control and status bits for the 3.0V regulator powered by the host USB VBUS pin.

Address: 20C_8000h base + 120h offset = 20C_8120h

PMU_REG_3P0 field descriptions

Field	Description
31–18 -	This field is reserved.

Table continues on the next page...

PMU_REG_3P0 field descriptions (continued)

Field	Description
17 OK_VDD3P0	Status bit that signals when the regulator output is ok. 1 = regulator output > brownout target
16 BO_VDD3P0	Status bit that signals when a brownout is detected on the regulator output.
15–13 -	This field is reserved.
12–8 OUTPUT_TRG	Control bits to adjust the regulator output voltage. Each LSB is worth 25mV. Programming examples are detailed below. Other output target voltages may be interpolated from these examples. NOTE: There may be reduced chip functionality or reliability at the extremes of the programming range. 0x00 2.625V 0x0f 3.000V 0x1f 3.400V
7 VBUS_SEL	Select input voltage source for LDO_3P0 from either USB_OTG1_VBUS or USB_OTG2_VBUS. If only one of the two VBUS voltages is present, it is automatically selected. 0 USB_OTG1_VBUS — Utilize VBUS OTG1 for power 1 USB_OTG2_VBUS — Utilize VBUS OTG2 power
6–4 BO_OFFSET	Control bits to adjust the regulator brownout offset voltage in 25mV steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may not be relevant because of input supply limitations or load operation.
3 -	Reserved
2 ENABLE_ILIMIT	Control bit to enable the current-limit circuitry in the regulator.
1 ENABLE_BO	Control bit to enable the brownout circuitry in the regulator.
0 ENABLE_LINREG	Control bit to enable the regulator output to be set by the programmed target voltage setting and internal bandgap reference.

40.6.3 Regulator 2P5 Register (PMU_REG_2P5)

This register defines the control and status bits for the 2.5V regulator.

Address: 20C_8000h base + 130h offset = 20C_8130h

PMU Memory Map/Register Definition

PMU_REG_2P5 field descriptions

Field	Description
31–19 -	This field is reserved.
18 ENABLE_WEAK_LINREG	Enables the weak 2p5 regulator. This low power regulator is used when the main 2p5 regulator is disabled to keep the 2.5V output roughly at 2.5V. Scales directly with the value of VDDHIGH_IN.
17 OK_VDD2P5	Status bit that signals when the regulator output is ok. 1 = regulator output > brownout target
16 BO_VDD2P5	Status bit that signals when a brownout is detected on the regulator output.
15–13 -	This field is reserved.
12–8 OUTPUT_TRG	Control bits to adjust the regulator output voltage. Each LSB is worth 25mV. Programming examples are detailed below. Other output target voltages may be interpolated from these examples. NOTE: There may be reduced chip functionality or reliability at the extremes of the programming range. 0x00 2.10V 0x10 2.50V 0x1f 2.875V
7 -	This field is reserved.
6–4 BO_OFFSET	Control bits to adjust the regulator brownout offset voltage in 25mV steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.
3 ENABLE_PULLDOWN	Control bit to enable the pull-down circuitry in the regulator

Table continues on the next page...

PMU_REG_2P5 field descriptions (continued)

Field	Description
2 ENABLE_ILIMIT	Control bit to enable the current-limit circuitry in the regulator.
1 ENABLE_BO	Control bit to enable the brownout circuitry in the regulator.
0 ENABLE_LINREG	Control bit to enable the regulator output.

40.6.4 Digital Regulator Core Register (PMU_REG_CORE)

This register defines the function of the digital regulators

Address: 20C_8000h base + 140h offset = 20C_8140h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	Reserved		FET_ODRIVE	RAMP_RATE		Reserved			REG2_TARG				Reserved				
W	Reserved		FET_ODRIVE	RAMP_RATE		Reserved			REG2_TARG				Reserved				
Reset	0	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W	Reserved											REG0_TARG					
Reset	0	0	1	0	0	0	0	0	0	0	0	0	1	0	0	1	0

PMU_REG_CORE field descriptions

Field	Description
31–30 -	This field is reserved.
29 FET_ODRIVE	If set, increases the gate drive on power gating FETs to reduce leakage in the off state. Care must be taken to apply this bit only when the input supply voltage to the power FET is less than 1.1V. NOTE: This bit should only be used in low-power modes where the external input supply voltage is nominally 0.9V.
28–27 RAMP_RATE	Regulator voltage ramp rate. 00 Fast 01 Medium Fast

Table continues on the next page...

PMU_REG_CORE field descriptions (continued)

Field	Description
	10 Medium Slow 11 Slow
26–23 -	This field is reserved.
22–18 REG2_TARG	<p>This field defines the target voltage for the SOC power domain. Single-bit increments reflect 25mV core voltage steps. Some steps may not be relevant because of input supply limitations or load operation.</p> <p>NOTE: This register is capable of programming an over-voltage condition on the device. Consult the datasheet Operating Ranges table for the allowed voltages.</p> <p>00000 Power gated off 00001 Target core voltage = 0.725V 00010 Target core voltage = 0.750V 00011 Target core voltage = 0.775V ... 10000 Target core voltage = 1.100V ... 11110 Target core voltage = 1.450V 11111 Power FET switched full on. No regulation.</p>
17–5 -	This field is reserved. Reserved
REG0_TARG	<p>This field defines the target voltage for the ARM core power domain. Single-bit increments reflect 25mV core voltage steps. Some steps may not be relevant because of input supply limitations or load operation.</p> <p>NOTE: This register is capable of programming an over-voltage condition on the device. Consult the datasheet Operating Ranges table for the allowed voltages.</p> <p>00000 Power gated off 00001 Target core voltage = 0.725V 00010 Target core voltage = 0.750V 00011 Target core voltage = 0.775V ... 10000 Target core voltage = 1.100V ... 11110 Target core voltage = 1.450V 11111 Power FET switched full on. No regulation.</p>

40.6.5 Miscellaneous Register 0 (PMU_MISC0)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 20C_8000h base + 150h offset = 20C_8150h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PMU_MISC0 field descriptions

Field	Description
31 VID_PLL_ PREDIV	Predivider for the source clock of the PLL's. 0 Divide by 1 1 Divide by 2
30 XTAL_24M_PWD	This field powers down the 24M crystal oscillator if set true.
29 RTC_XTAL_ SOURCE	This field indicates which chip source is being used for the rtc clock. 0 Internal ring oscillator 1 RTC_XTAL
28–26 CLKGATE_ DELAY	This field specifies the delay between powering up the XTAL 24MHz clock and releasing the clock to the digital logic inside the analog block. NOTE: Do not change the field during a low power event. This is not a field that the user would normally need to modify. NOTE: Not related to PMU. 000 0.5ms 001 1.0ms 010 2.0ms 011 3.0ms 100 4.0ms 101 5.0ms 110 6.0ms 111 7.0ms
25 CLKGATE_CTRL	This bit allows disabling the clock gate (always ungated) for the xtal 24MHz clock that clocks the digital logic in the analog block. NOTE: Do not change the field during a low power event. This is not a field that the user would normally need to modify. NOTE: Not related to PMU. 0 ALLOW_AUTO_GATE — Allow the logic to automatically gate the clock when the XTAL is powered down. 1 NO_AUTO_GATE — Prevent the logic from ever gating off the clock.
24–17 -	This field is reserved. Always set to zero.
16 OSC_XTALOK_ EN	This bit enables the detector that signals when the 24MHz crystal oscillator is stable. NOTE: Not related to PMU, Clocking content
15 OSC_XTALOK	Status bit that signals that the output of the 24-MHz crystal oscillator is stable. Generated from a timer and active detection of the actual frequency. NOTE: Not related to PMU, clocking content.
14–13 OSC_I	This field determines the bias current in the 24MHz oscillator. The aim is to start up with the highest bias current, which can be decreased after startup if it is determined to be acceptable.

Table continues on the next page...

PMU_MISC0 field descriptions (continued)

Field	Description
	<p>NOTE: Not related to PMU.</p> <p>00 NOMINAL — Nominal 01 MINUS_12_5_PERCENT — Decrease current by 12.5% 10 MINUS_25_PERCENT — Decrease current by 25.0% 11 MINUS_37_5_PERCENT — Decrease current by 37.5%</p>
12 DISCON_HIGH_ SNVS	<p>This bit controls a switch from VDD_HIGH_IN to VDD_SNVS_IN.</p> <p>0 Turn on the switch 1 Turn off the switch</p>
11–10 STOP_MODE_ CONFIG	<p>Configure the analog behavior in stop mode.</p> <p>00 SUSPEND (DSM) — All analog except rtc powered down on stop mode assertion. 01 STANDBY — Analog regulators are ON. 10 STOP (lower power) — Analog regulators are ON. 11 STOP (very lower power) — Analog regulators are OFF.</p>
9–8 -	<p>This field is reserved. Reserved</p>
7 REFTOP_ VBGUP	<p>Status bit that signals the analog bandgap voltage is up and stable. 1 - Stable.</p>
6–4 REFTOP_ VBGADJ	<p>000 Nominal VBG 001 VBG+0.78% 010 VBG+1.56% 011 VBG+2.34% 100 VBG-0.78% 101 VBG-1.56% 110 VBG-2.34% 111 VBG-3.12%</p>
3 REFTOP_ SELFBIASOFF	<p>Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap.</p> <p>NOTE: Value should be returned to zero before removing vddhigh_in or asserting bit 0 of this register (REFTOP_PWD) to assure proper restart of the circuit.</p> <p>0 Uses coarse bias currents for startup 1 Uses bandgap-based bias currents for best performance.</p>
2–1 -	<p>This field is reserved.</p>
0 REFTOP_PWD	<p>Control bit to power-down the analog bandgap reference circuitry.</p> <p>NOTE: A note of caution, the bandgap is necessary for correct operation of most of the LDO, pll, and other analog functions on the die.</p>

40.6.6 Miscellaneous Register 1 (PMU_MISC1n)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 20C_8000h base + 160h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

10001	PFD3 — ref_pfd3_clk == pll3_pfd3_clk
10010	XTAL — xtal (24M)
10101 to 11111	ref_pfd7_clk == pll2_pfd3_clk

40.6.7 Miscellaneous Control Register (PMU_MISC2n)

This register defines the control for miscellaneous PMU Analog blocks.

NOTE

This register is shared with CCM.

Address: 20C_8000h base + 170h offset + (4d × i), where i=0d to 3d

PMU Memory Map/Register Definition

PMU_MISC2n field descriptions

Field	Description
31–30 VIDEO_DIV	<p>Post-divider for video. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_VIDEOOn[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4, /8, and /16.</p> <p>NOTE: Not related to PMU. See Clock Controller Module (CCM) for more information.</p> <p>00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4</p>
29–28 REG2_STEP_ TIME	<p>Number of clock periods (24MHz clock).</p> <p>00 64_CLOCKS — 64 01 128_CLOCKS — 128 10 256_CLOCKS — 256 11 512_CLOCKS — 512</p>
27–26 -	<p>This field is reserved. Reserved</p>

Table continues on the next page...

PMU_MISC2n field descriptions (continued)

Field	Description
25–24 REG0_STEP_ TIME	Number of clock periods (24MHz clock). 00 64_CLOCKS — 64 01 128_CLOCKS — 128 10 256_CLOCKS — 256 11 512_CLOCKS — 512
23 AUDIO_DIV_ MSB	MSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDION[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4, /8, and /16. NOTE: MSB bit value pertains to the first bit, please program the LSB bit (bit 15) as well to change divider value NOTE: Not related to PMU. See Clock Controller Module (CCM) for more information. 00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4
22 REG2_OK	Signals that the voltage is above the brownout level for the SOC supply. 1 = regulator output > brownout_target
21 REG2_ENABLE_ BO	Enables the brownout detection.
20 -	This field is reserved.
19 REG2_BO_ STATUS	Reg2 brownout status bit.
18–16 REG2_BO_ OFFSET	This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation. 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V
15 AUDIO_DIV_LSB	LSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDION[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4, /8, and /16. NOTE: LSB bit value pertains to the last bit, please program the MSB bit (bit 23) as well, to change divider value NOTE: Not related to PMU. See Clock Controller Module (CCM) for more information. 00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4
14–8 -	This field is reserved.

Table continues on the next page...

PMU_MISC2n field descriptions (continued)

Field	Description
7 PLL3_disable	Default value of "0". Should be set to "1" to turn off the USB-PLL(PLL3) in run mode. NOTE: Not related to PMU. See Clock Controller Module (CCM) for more information.
6 -	This field is reserved.
5 REG0_ENABLE_ BO	Enables the brownout detection.
4 -	This field is reserved.
3 REG0_BO_ STATUS	Reg0 brownout status bit. 1 Brownout, supply is below target minus brownout offset.
REG0_BO_ OFFSET	This field defines the brown out voltage offset for the CORE power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. Some steps may be irrelevant because of input supply limitations or load operation. 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V

40.6.8 Low Power Control Register (PMU_LOWPWR_CTRLn)

This register defines the low power configuration bits.

Address: 20C_8000h base + 270h offset + (4d × i), where i=0d to 2d

PMU Memory Map/Register Definition

PMU_LOWPWR_CTRLn field descriptions

Field	Description
31–19 -	This field is reserved.
18 Reserved	This read-only field is reserved and always has the value 0.
17 MIX_PWRGATE	Display power gate control. Used as software mask. Set to zero to force ungated.
16 XTALOSC_PWRUP_STAT	Status of the 24MHz xtal oscillator. NOTE: Not related to PMU. 0 Not stable 1 Stable and ready to use
15–14 XTALOSC_PWRUP_DELAY	Specifies the time delay between when the 24MHz xtal is powered up until it is stable and ready to use. NOTE: Not related to PMU. 00 0.25ms 01 0.5ms 10 1ms 11 2ms
13 RCOSC_CG_OVERRIDE	For debug purposes only. This bit effects clock gating of certain digital logic clocked by the 24MHz clk. NOTE: Not related to PMU.
12 -	Reserved

Table continues on the next page...

PMU_LOWPWR_CTRLn field descriptions (continued)

Field	Description
11 DISPLAY_ PWRGATE	Display logic power gate control. Used as software override.
10 CPU_PWRGATE	CPU power gate control. Used as software override. Attention: Test purpose only
9 L2_PWRGATE	L2 power gate control. Used as software override.
8 L1_PWRGATE	L1 power gate control. Used as software override.
7 REFTOP_IBIAS_ OFF	Low power reftop ibias disable.
6 LPBG_TEST	Low power bandgap test bit.
5 LPBG_SEL	Bandgap select. 0 Normal power bandgap 1 Low power bandgap
4 OSC_SEL	Select the source for the 24MHz clock. NOTE: Not related to PMU. 0 XTAL OSC 1 RC OSC
3-1 RC_OSC_PROG	RC osc. tuning values. NOTE: Not related to PMU.
0 RC_OSC_EN	RC Osc. enable control. NOTE: Not related to PMU. 0 Use XTAL OSC to source the 24MHz clock 1 Use RC OSC

Chapter 41

Pulse Width Modulation (PWM)

41.1 Overview

The Pulse Width Modulation (PWM) has a 16-bit counter, and is optimized to generate sound from stored sample audio images and it can also generate tones. It uses 16-bit resolution and a 4 x 16 data FIFO.

This section presents an overview of the PWM. A block diagram of the PWM module is shown in the figure below.

Figure 41-1. Pulse-Width Modulator Block Diagram

The following features characterize the PWM:

- 16-bit up-counter with clock source selection
- 4 x 16 FIFO to minimize interrupt overhead
- 12-bit prescaler for division of clock
- Sound and melody generation
- Active high or active low configured output
- Can be programmed to be active in low-power mode
- Can be programmed to be active in debug mode
- Interrupts at compare and rollover

41.2 External Signals

The PWM follows IP Bus protocol when interfacing with the processor core. PWM does not have any interface signals with any other block inside the chip except for clock and reset inputs from the Clock Control Module (CCM), System Reset Controller (SRC), and interrupt signals to the processor interrupt handler. There is a single output signal.

The following table outlines the external signals.

Table 41-1. PWM External Signals

Signal	Description	Pad	Mode	Direction
PWM1_OUT	This is the PWM1 functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	ENET1_RX_DATA0	ALT2	O
		GPIO1_IO08	ALT0	
		LCD_DATA00	ALT1	
PWM2_OUT	This is the PWM2 functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	ENET1_RX_DATA1	ALT2	O
		GPIO1_IO09	ALT0	
		LCD_DATA01	ALT1	
PWM3_OUT	This is the PWM3 functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	GPIO1_IO04	ALT1	O
		LCD_DATA02	ALT1	
		NAND_ALE	ALT3	
PWM4_OUT	This is the PWM4 functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	GPIO1_IO05	ALT1	O
		LCD_DATA03	ALT1	
		NAND_WP_B	ALT3	
PWM5_OUT	This is the PWM5 functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	ENET1_TX_DATA1	ALT2	O
		LCD_DATA18	ALT1	
		NAND_DQS	ALT3	
PWM6_OUT	This is the PWM6 functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	ENET1_TX_EN	ALT2	O
		JTAG_TDI	ALT4	
		LCD_DATA19	ALT1	
PWM7_OUT	This is the PWM7 functional output of the PWM. A modulated signal of	CSI_VSYNC	ALT6	O
		ENET1_TX_CLK	ALT2	

Table continues on the next page...

Table 41-1. PWM External Signals (continued)

Signal	Description	Pad	Mode	Direction
	the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	JTAG_TCK	ALT4	
PWM8_OUT	This is the PWM8 functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	CSI_HSYNC	ALT6	O
		ENET1_RX_ER	ALT2	
		JTAG_TRST_B	ALT4	

41.3 Clocks

The table found here describes the clock sources for PWM. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 41-2. PWM Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	low-frequency reference clock (32 kHz)
ipg_clk_highfreq	perclk_clk_root	high-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

The clock that feeds the prescaler can be selected from:

- High-frequency reference clock (ipg_clk_highfreq) pat_ref or CKIH

This is a high frequency clock, provided by the Clock Control Module (CCM). This clock should be on in the low power mode when the ipg_clk is turned off. Thus, the PWM can be run on this clock in the low power mode. The CCM is expected to provide this clock after synchronizing it to ahb_clk in the normal functional mode and then switch to the unsynchronized version in the low power mode.

- Low-frequency reference clock (ipg_clk_32k, CKIL)

This is the 32 KHz low reference clock which is provided by the CCM. This clock should be on in the low power mode when `ipg_clk` is turned off. Thus, PWM can be run on this clock in the low power mode. The CCM is expected to provide this clock after synchronizing it to `ahb_clk` in the normal functional mode and then switch to the unsynchronized version in the low power mode.

- Peripheral clock (`ipg_clk`)

This clock should be on in normal operations. In low power mode, it can be switched off.

- Peripheral access clock (`ipg_clk_s`)

This clock is used for register read/write.

The clock input source is determined by the PWM control register field `PWM_CR[CLKSRC]`. The `CLKSRC` value should only be changed when the PWM is disabled.

A change in the value of the `PRESCALER` field of the control register is immediately reflected on its output clock frequency.

41.4 Functional Description

The following sections detail the PWM operation and function.

41.4.1 Operation

The output of the PWM is a toggling signal whose frequency and duty cycle can be modulated by programming the appropriate registers. It has a 16-bit up counter which counts from `0x0000` until the counter value equals the `PWM_PR + 1`. After this match occurs the counter is reset to `0x0000`.

At the beginning of a count period cycle, the `PWMO` pin is set to one (default) and the counter begins counting up from `0x0000`. The sample value in the sample FIFO is compared on each count of prescaler clock. When the sample and count values match, the `PWMO` signal is cleared to zero (default). The counter continues counting until the period match occurs and subsequently another period cycle begins.

When the PWM is enabled, the counter starts running and generates an output with the reset values in the period and sample registers. It is recommended that the programming of these registers be done before PWM is enabled.

A hardware reset results in all the PWM count and sample registers being cleared and the FIFO being flushed. The control register shows that FIFO is empty and it can be written into, and the PWM is disabled. A software reset has the same results, however the state of the DBGEN, STOPEN, DOZEN, and WAITEN bits in the control register are not affected. Software reset can be asserted even when the PWM is in disabled state.

41.4.1.1 FIFO

Digital sample values can be loaded into the pulse-width modulator as 16-bit words. The endianness can be changed using the BCTR and HCTR bits of the control register. A 4-word (16-bit) FIFO minimizes interrupt overhead. A maskable interrupt is generated when the number of data words fall below the water level set by the FWM field in the control register.

A write to the PWM_SAR sample register results in the value being stored into the FIFO if it is not full. A write when the FIFO is full sets FWE (FIFO write error) bit in the status register and the FIFO contents remain unchanged. The FIFO can be written at any time, but can be read only when the PWM is enabled. The PWM_SR[FIFOAV] field shows how many data words are currently contained in the FIFO and whether or not it can be written into.

A read on the sample register yields the current FIFO value that is being used, or will be used, by the PWM for generation on the output signal. Therefore, a write and a subsequent read on the sample register may result in different values being obtained.

41.4.1.2 Rollover and Compare Event

The counter is reset to 0x0000 after its value equals the PWM_PR[PERIOD] + 1 and resumes counting thereafter. This event is referred to as a rollover. For example, if PWM_PR[PERIOD] = 0x0000, the counter is reset when it equals 0x0001. When PWM_PR[PERIOD] = 0xFFFF or 0xFFFE, the counter is reset when it equals 0xFFFF. For more information, see the PWM Period Register (PWM_PR) description.

During a rollover event the output is either set (default), reset or has no effect according to the programming of the POUTC field in the control register. This event can also generate an interrupt if the respective interrupt enable bit is set in the control register.

When the counter value reaches the sample value, the output of the PWM is reset (default), set or has no effect according to the programming of the POUTC field of control register. This event is referred to as a compare event. This event can also generate an interrupt if the respective interrupt enable bit is set in the control register.

If the rollover event sets the PWM output signal, the compare event will reset it and vice versa for a particular programming configuration of POUTC field.

41.4.1.3 Low Power Mode Behavior

In low power mode, if the clock from the selected clock source is available, the PWM counter continues to run and an output is produced, depending on whether the control bit for that mode is set or not. In the absence of the clock itself, or if the corresponding low power bit in the control register is 0, the counter is reset and resumes counting when it exits the low power mode.

41.4.1.4 Debug Mode Behavior

In debug mode, PWM has the option of continuing to run or be halted. If the DBGEN bit is not set in the PWM_PWMCR, the PWM is halted. If the DBGEN bit is set, then the PWM will continue to run in the debug mode.

41.5 Enable Sequence for the PWM

The sequence found here should be used to enable the PWM.

1. Configure the desired settings for the PWM Control Register (PWM_x_PWMCR) while keeping the PWM disabled (PWM_x_PWMCR[0]=0).
2. Enable the desired interrupts in the PWM Interrupt Register (PWM_x_PWMIR).
3. One to three initial samples may be written to the PWM Sample Register (PWM_x_PWMSAR). The initial sample values will be loaded into the PWM FIFO even if the PWM is not yet enabled. Do not write a 4th sample because the FIFO will become full and trigger a FIFO Write Error (FWE). This error will prevent the PWM from starting once it is enabled.
4. Check the FIFO Write Error status bit (FWE), the Compare status bit (CMP) and the Roll-over status bit (ROV) in the PWM Status Register (PWM_x_PWMSR) to make sure they are all zero. Any non-zero status bits should be cleared by writing a 1 to them.
5. Write the desired period to the PWM Period Register (PWM_x_PWMPR).
6. Enable the PWM by writing a 1 to the PWM Enable bit, PWM_x_PWMCR[0], while maintaining the other register bits in their previously configured state.

41.6 Disable Sequence for the PWM

The PWM can be disabled at any time by clearing the PWM enable bit, PWM_x_PWMCR[0] to 0.

Any data remaining in the FIFO will not be produced at the PWM output after the PWM has been disabled and will remain in the FIFO until the PWM is enabled again. A software reset (setting PWM_x_PWMCR[3] to 1) or a hardware reset will clear the FIFO and any remaining data will be lost.

41.7 PWM Memory Map/Register Definition

The PWM includes six user-accessible 32-bit registers.

PWM memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
208_0000	PWM Control Register (PWM1_PWMCR)	32	R/W	0000_0000h	41.7.1/2462
208_0004	PWM Status Register (PWM1_PWMSR)	32	w1c	0000_0008h	41.7.2/2464
208_0008	PWM Interrupt Register (PWM1_PWMIR)	32	R/W	0000_0000h	41.7.3/2465
208_000C	PWM Sample Register (PWM1_PWMSAR)	32	R/W	0000_0000h	41.7.4/2466
208_0010	PWM Period Register (PWM1_PWMPR)	32	R/W	0000_FFFEh	41.7.5/2467
208_0014	PWM Counter Register (PWM1_PWMCNR)	32	R	0000_0000h	41.7.6/2468
208_4000	PWM Control Register (PWM2_PWMCR)	32	R/W	0000_0000h	41.7.1/2462
208_4004	PWM Status Register (PWM2_PWMSR)	32	w1c	0000_0008h	41.7.2/2464
208_4008	PWM Interrupt Register (PWM2_PWMIR)	32	R/W	0000_0000h	41.7.3/2465
208_400C	PWM Sample Register (PWM2_PWMSAR)	32	R/W	0000_0000h	41.7.4/2466
208_4010	PWM Period Register (PWM2_PWMPR)	32	R/W	0000_FFFEh	41.7.5/2467
208_4014	PWM Counter Register (PWM2_PWMCNR)	32	R	0000_0000h	41.7.6/2468
208_8000	PWM Control Register (PWM3_PWMCR)	32	R/W	0000_0000h	41.7.1/2462

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PWMx_PWMCR field descriptions

Field	Description
31–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–26 FWM	FIFO Water Mark. These bits are used to set the data level at which the FIFO empty flag will be set and the corresponding interrupt generated 00 FIFO empty flag is set when there are more than or equal to 1 empty slots in FIFO 01 FIFO empty flag is set when there are more than or equal to 2 empty slots in FIFO 10 FIFO empty flag is set when there are more than or equal to 3 empty slots in FIFO 11 FIFO empty flag is set when there are more than or equal to 4 empty slots in FIFO
25 STOPEN	Stop Mode Enable. This bit keeps the PWM functional while in stop mode. When this bit is cleared, the input clock is gated off in stop mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in stop mode 1 Active in stop mode
24 DOZEN	Doze Mode Enable. This bit keeps the PWM functional in doze mode. When this bit is cleared, the input clock is gated off in doze mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in doze mode 1 Active in doze mode
23 WAITEN	Wait Mode Enable. This bit keeps the PWM functional in wait mode. When this bit is cleared, the input clock is gated off in wait mode. This bit is not affected by software reset. It is cleared by hardware reset.

Table continues on the next page...

PWMx_PWMCR field descriptions (continued)

Field	Description
	0 Inactive in wait mode 1 Active in wait mode
22 DBGEN	Debug Mode Enable. This bit keeps the PWM functional in debug mode. When this bit is cleared, the input clock is gated off in debug mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in debug mode 1 Active in debug mode
21 BCTR	Byte Data Swap Control. This bit determines the byte ordering of the 16-bit data when it goes into the FIFO from the sample register. 0 byte ordering remains the same 1 byte ordering is reversed
20 HCTR	Half-word Data Swap Control. This bit determines which half word data from the 32-bit IP Bus interface is written into the lower 16 bits of the sample register. 0 Half word swapping does not take place 1 Half words from write data bus are swapped
19–18 POUTC	PWM Output Configuration. This bit field determines the mode of PWM output on the output pin. 00 Output pin is set at rollover and cleared at comparison 01 Output pin is cleared at rollover and set at comparison 10 PWM output is disconnected 11 PWM output is disconnected
17–16 CLKSRC	Select Clock Source. These bits determine which clock input will be selected for running the counter. After reset the system functional clock is selected. The input clock can also be turned off if these bits are set to 00. This field value should only be changed when the PWM is disabled 00 Clock is off 01 ipg_clk 10 ipg_clk_highfreq 11 ipg_clk_32k
15–4 PRESCALER	Counter Clock Prescaler Value. This bit field determines the value by which the clock will be divided before it goes to the counter. 0x000 Divide by 1 0x001 Divide by 2 0xff Divide by 4096
3 SWR	Software Reset. PWM is reset when this bit is set to 1. It is a self clearing bit. A write 1 to this bit is a single wait state write cycle. When the block is in reset state this bit is set and is cleared when the reset procedure is over. Setting this bit resets all the registers to their reset values except for the DBGEN, STOPEN, DOZEN, and WAITEN bits in this control register. 0 PWM is out of reset 1 PWM is undergoing reset
2–1 REPEAT	Sample Repeat. This bit field determines the number of times each sample from the FIFO is to be used. 00 Use each sample once 01 Use each sample twice 10 Use each sample four times 11 Use each sample eight times

Table continues on the next page...

PWMx_PWMCR field descriptions (continued)

Field	Description
0 EN	<p>PWM Enable. This bit enables the PWM. If this bit is not enabled, the clock prescaler and the counter is reset. When the PWM is enabled, it begins a new period, the output pin is set to start a new period while the prescaler and counter are released and counting begins.</p> <p>To make the PWM work with softreset and disable/enable, users can do software reset by setting the SWR bit, wait software reset done, configure the registers, and then enable the PWM by setting this bit to "1"</p> <p>Users can also disable/enable the PWM if PWM would like to be stopped and resumed with same registers configurations .</p> <p>0 PWM disabled 1 PWM enabled</p>

41.7.2 PWM Status Register (PWMx_PWMSR)

The PWM status register (PWM_PWMSR) contains seven bits which display the state of the FIFO and the occurrence of rollover and compare events. The FIFOAV bit is read-only but the other four bits can be cleared by writing 1 to them. The FE, ROV, and CMP bits are associated with FIFO-Empty, Roll-over, and Compare interrupts, respectively.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W	[Shaded]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PWMx_PWMSR field descriptions

Field	Description
31–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6 FWE	<p>FIFO Write Error Status. This bit shows that an attempt has been made to write FIFO when it is full.</p> <p>0 FIFO write error not occurred 1 FIFO write error occurred</p>
5 CMP	<p>Compare Status. This bit shows that a compare event has occurred.</p> <p>0 Compare event not occurred 1 Compare event occurred</p>

Table continues on the next page...

PWMx_PWMSR field descriptions (continued)

Field	Description
4 ROV	Roll-over Status. This bit shows that a roll-over event has occurred. 0 Roll-over event not occurred 1 Roll-over event occurred
3 FE	FIFO Empty Status Bit. This bit indicates the FIFO data level in comparison to the water level set by FWM field in the control register. 0 Data level is above water mark 1 When the data level falls below the mark set by FWM field
FIFOAV	FIFO Available. These read-only bits indicate the data level remaining in the FIFO. An attempted write to these bits will not affect their value and no transfer error is generated. 000 No data available 001 1 word of data in FIFO 010 2 words of data in FIFO 011 3 words of data in FIFO 100 4 words of data in FIFO 101 unused 110 unused 111 unused

41.7.3 PWM Interrupt Register (PWMx_PWMIR)

The PWM Interrupt register (PWM_PWMIR) contains three bits which control the generation of the compare, rollover and FIFO empty interrupts.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	0													CIE	RIE	FIE
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PWMx_PWMIR field descriptions

Field	Description
31–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 CIE	Compare Interrupt Enable. This bit controls the generation of the Compare interrupt.

Table continues on the next page...

PWMx_PWMIR field descriptions (continued)

Field	Description
	0 Compare Interrupt not enabled 1 Compare Interrupt enabled
1 RIE	Roll-over Interrupt Enable. This bit controls the generation of the Rollover interrupt. 0 Roll-over interrupt not enabled 1 Roll-over Interrupt enabled
0 FIE	FIFO Empty Interrupt Enable. This bit controls the generation of the FIFO Empty interrupt. 0 FIFO Empty interrupt disabled 1 FIFO Empty interrupt enabled

41.7.4 PWM Sample Register (PWMx_PWMSAR)

The PWM sample register (PWM_PWMSAR) is the input to the FIFO. 16-bit words are loaded into the FIFO. The FIFO can be written at any time, but can be read only when the PWM is enabled. The PWM will run at the last set duty-cycle setting if all the values of the FIFO has been utilized, until the FIFO is reloaded or the PWM is disabled. When a new value is written, the duty cycle changes after the current period is over.

A value of zero in the sample register will result in the PWMO output signal always being low/high (POUTC = 00 it will be low and POUTC = 01 it will be high), and no output waveform will be produced. If the value in this register is higher than the PERIOD + 1, the output will never be set/reset depending on POUTC value.

Address: Base address + Ch offset

PWMx_PWMSAR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
SAMPLE	Sample Value. This is the input to the 4x16 FIFO. The value in this register denotes the value of the sample being currently used.

41.7.5 PWM Period Register (PWMx_PWMPR)

The PWM period register (PWM_PWMPR) determines the period of the PWM output signal. After the counter value matches PERIOD + 1, the counter is reset to start another period.

$$\text{PWMO (Hz)} = \text{PCLK(Hz)} / (\text{period} + 2)$$

A value of zero in the PWM_PWMPR will result in a period of two clock cycles for the output signal. Writing 0xFFFF to this register will achieve the same result as writing 0xFFFE.

A change in the period value due to a write in PWM_PWMPR results in the counter being reset to zero and the start of a new count period.

NOTE

Settings PWM_PWMPR to 0xFFFF when PWMx_PWMCR REPEAT bits are set to non-zero values is not allowed.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																PERIOD															
W	1																1															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0

PWMx_PWMPR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
PERIOD	Period Value. These bits determine the Period of the count cycle. The counter counts up to [Period Value] +1 and is then reset to 0x0000.

41.7.6 PWM Counter Register (PWMx_PWMCNR)

The read-only pulse-width modulator counter register (PWM_PWMCNR) contains the current count value and can be read at any time without disturbing the counter.

Address: Base address + 14h offset

PWMx_PWMCNR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Counter Value. These bits are the counter register value and denotes the current count state the counter register is in.

Chapter 42

Pixel Pipeline (PXP)

42.1 Overview

This document describes the micro-architecture for the Pixel Processing Pipeline used to process graphics buffers or composite video and graphics data before sending to an LCD display or TV encoder.

It is used to minimize the memory footprint required for the display pipeline and provide an area and performance optimized to both SDRAM-less and SRAM-based systems.

The PXP integrates of several independent processing stages into a cohesive strategy to create flexible pixel pipeline.

The PXP combines scaling, color space conversion (or CSC), alpha-blending, secondary color space conversion (or CSC2), pixel conversion lookup memory table (or LUT) ,rotation , dithering and waveform processing into a single processing engine, as shown in [Figure 42-1](#). By integrating multiple blocks, intermediate buffer operations to external memory are removed, reducing external memory bandwidth, power, and software control complexity.

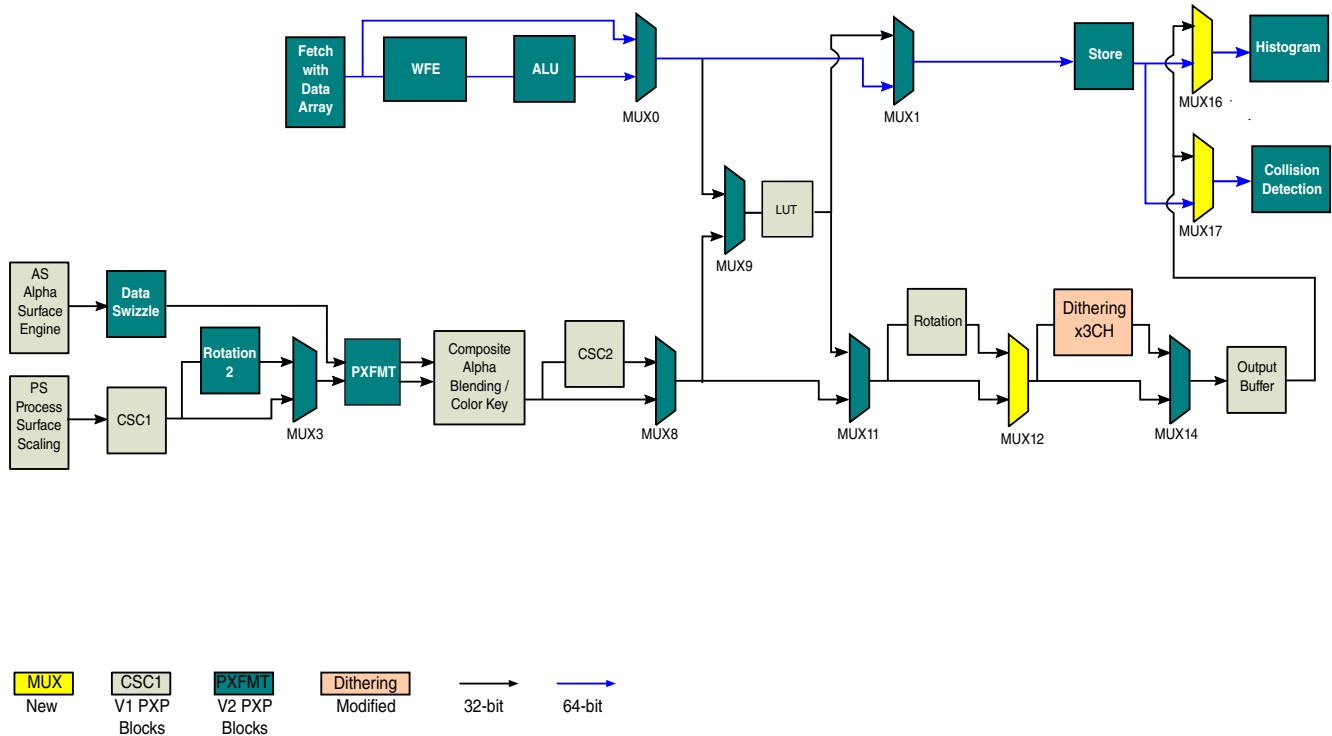

Figure 42-1. PXP Architecture

42.2 Clocks

The following table describes the clock sources for PXP. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 42-1. PXP Clocks

Clock name	Clock Root	Description
clk	axi_clk_root	PXP clock

42.3 Top-level architecture

The PXP consist of several pipelined blocks that perform the video source frame scaling, color space conversion, alpha-blending/color key algorithm, secondary CSC, pixel correction , input and/or output rotation, dithering and waveform processing.

The legacy blocks operate within the requirements of the legacy PXP architecture, and perform operations on either 8x8 or 16x16 pixel blocks in the representative source buffers. The legacy pipeline operate within the context of two iteration counters that iterate through the appropriate grid of input blocks to produce the rotated output grid blocks in scan-line order. The dither blocks included in the legacy pipeline also operate in a block mode while the waveform processing engines (WFE) will operate in a scan line format based on the active size.

Figure 42-1 shows the high-level architecture of the scaling, color space conversion, blending, pixel correction, rotation engines, dithering, waveform processing, along with histogram. The Alpha Surface Engine fetches one RGB graphics plane alpha surface (AS). The scaling engine fetches a single processed surface (PS), which can be blended with the AS surface. The scaling engine also supports an alpha channel for the PS image. Although the legacy PXP processes NxN pixel macro blocks, each of the AS or PS surfaces can have any pixel alignment within the output buffer. There are no restrictions and any pixel coordinates within the output buffer are valid. The upper left origin of the output buffer is defined as pixel 0,0. The upper left and lower right coordinates for each of the AS and PS are inclusive within the output buffer.

Figure 42-2 represents a sample output buffer configuration with both an AS and PS included. The alignment of each AS and PS within the output buffer can be at any arbitrary pixel locations. For example, the PS has an upper left coordinate (ULC) of 2,2 and a lower right coordinate (LRC) at pixel 13,13. The maximum value for the ULC and LRC for each of the AS and PS is bounded by the LRC of the output buffer, 15,15 for this example.

Figure 42-2. Sample output buffer configuration

The AS engine supports RGB pixel formats, and the PS engine supports ARGB, RGB, YUV, and YCbCr pixel formats. The CSC1 can be used to convert to RGB pixel formats so that the PS surface can be blended with the AS surfaces in the compositing engine in the RGB color space. There are two rotate engines in the PXP pipeline. Rotation can occur after image composition, at the output of the PS engine, or both. In the first scenario, all the data produced by the AS and PS engines is rotated. When the rotation module is programmed to rotate only PS images, the AS is not rotated, and AS pixels are combined with rotated PS surfaces. The CSC2 unit can convert to any RGB, YUV, or YCbCr color spaces for final output. Pixels can be corrected using a programmable LUT resource to achieve any desired pixels effects. For detailed information, please refer to [Output Modes to RGBW4444CFA](#). The dither engine supports ordered dithering mode in addition to the standard quantization and pass-through modes. The WFE is a programmable engine that can be programmed as required to process each pixel and pixel meta data. The Histogram sub-block collects statistics about the pixel data passing through it that is useful to the EPDC in waveform selection and displaying the frame. The Histogram also contains mask and comparison functionality that can be used for collision detection and reporting the collided area within an update area.

The PXP also supports two parallel image processing paths. The legacy flow can operate in parallel with waveform processing engines. Please refer to HW_PXP_CTRL and HW_PXP_CTRL2 for details on how to enable each of the individual data flows. In addition to this, LUT engine can be used as either part of the legacy flow or as a part of the second parallel data flow.

42.3.1 Processing Details

The legacy PXP architecture has been driven primarily by the requirement that the output buffer must be processed and rotated without intermediate frame buffer stored in external memory.

This reduces the use of external memory bandwidth requirements thus reducing overall system power consumed. The new architecture has two sets of fetch and store engines to enable parallel image processing and the ability to use only parts of the block like the WFE or parts of the legacy flow.

Since the output of the rotation block must be NxN pixel blocks in scan order, the entire legacy pipeline will operate on NxN pixel blocks. In essence, the pipeline will be able to operate on blocks in a random access fashion, but the entire pipeline will operate within the context of two iteration counters that will iterate through the horizontal and vertical input blocks to generate the required output block.

Legacy Processing Pipeline

The control block will coordinate the processing of the pixel blocks within the source and destination image buffers. It begins by issuing a command to each stage of the pipeline requesting that operations be done for the block at offset x, y. When the block accepts the command, it asserts its acknowledge signal for a single cycle to indicate the acceptance and allow the control unit to move to the next block.

When the PS and AS fetch engines have received a command, they will fetch the required data and place it into their fetch buffers. If compositing the RGB AS surface with the PS surface, then the output of the PS engine needs to be converted to the RGB color space using CSC1, since all compositing occurs in the RGB color space. For YUV output pixel formats, the CSC1 unit can be enabled to convert pixels into the RGB space for subsequent compositing with AS pixels. Then, the CSC2 module can convert the resulting pixels back into the YUV output color space. If the final output color space is YUV and there is no compositing required (AS not present, for example), then both the CSC units can be bypassed and the pixel data path will pass the YUV pixels to the rotation engine. For YUV output formats, scaling operations, LUT, rotation and dithering

operations are still valid, but blending RGB AS surfaces with YUV PS surfaces is NOT supported. The two CSC units in the overall pixel data path must be used to achieve the desired source frame compositing and output pixel formatting.

The alpha blender/color key module will process a pixel any time that both inputs present valid data.

A handshake will be created between each stage and a pipeline controller to handle the advance of the pipeline and generation of the iteration counters. The pipeline controller will also maintain the interlocks with the LCD interface for the case where the LCD display and pixel processing pipeline use the SRAM to maintain the double buffer block intermediate buffer.

The New Processing Pipelines

The WFE fetch and store engines work in scan line format. The WFE fetch engine has internal memory of 32 words where each word is 64 bits. The store engines can coordinate data flow through the pipeline to the next fetch engine such as LCDIF for display. In handshake mode, the store engine writes data to the memory and signals, the fetch engine of the next stage that the programmed number of lines are ready to be fetched.

42.3.2 Scaling Operation

The scaling engine operates on YUV (or YCbCr) 422 or 420 and any RGB formatted pixels. Each color plane is sourced from color planes indicated by different base address registers.

The scaling source data can be stored as 3 individual planes for each Y, U, and V data, stored as two planes as a single Y and interleaved UV plane, or stored as a single plane with YUV/RGB interleaved on a per byte basis.

The scaled output image is presented to the CSC module as YUV444 or RGB888 pixels with a single byte for each color channel. The scaler can reduce an input image by a maximum factor of 16. In this case, the output image will be 1/16 the dimension of the input image in each of the X and Y axis. There are no limits, essentially, on increasing the source image size. The theoretical maximum increase is 4096 since a 12 bit fractional step function is used when scaling an input image. Scaling in either axis, X or Y is independent, so a source image can appear stretched in either direction.

All source images pass through the scale engine. The PXP alpha blend module and AS pixel streams are in the RGB888 format, so PS pixel buffers must be converted to the RGB888 format for alpha blending. The scaling engine works with the CSC1 module to translate YUV/YCbCr pixel formats to RGB888 for output frame buffer compositing

using the alpha blender. The CSC2 module can be bypassed or enabled to convert pixels to any output color space. In the case of processing RGB pixels in the PS engine, the CSC1 unit can be bypassed so compositing can occur in the alpha engine.

The scaling operation is divided into two scaling steps. The first step is a decimation scaler, and the second step is a bilinear filter. The decimation filter provides a maximum down scaling factor of 8, and the subsequent bilinear filter provides a maximum scaling factor of 2. Combined, the maximum scaling factor can be up to 16. The decimation and bilinear scaling engines are independently programmable. There is also an initial offset that is programmable to allow more source data to be considered in the bilinear scaling engine.

42.3.3 Decimation Image Scaling

The first of two scaling engines is the decimation filter.

The intent of the decimation filter is to use as much source data as is possible to create the output image frame buffer. The decimation filter simply discards certain pixels from the source PS image depending on the reduction selected.

For RGB pixel formats, each color channel is treated equally since there is the same amount of pixel data within each color plane. For YUV422/420 formats, the chroma samples are already subsampled by 2. In these decimation scenarios, the chroma decimation factor is adjusted to account for the pre-decimation of the chroma samples. For example, since YUV422 is already sub-sampled by 2 horizontally, an X decimation factor of 2 does not apply to the YUV422 pixels in the X direction. All the chroma samples are passed on to the bilinear filter in this case. As another example, an X decimation factor of 4 will decimate the chroma samples by 2, since this factor combined with the pre-decimation factor of 2 in the pixel source buffers totals an overall decimation factor of 4.

The following example will show which pixels (in green) in a source RGB buffer that are passed to the bilinear filter for an X decimation factor of 2 and a Y decimation factor of 4. All pixels coincident with dashed lines are discarded.

Figure 42-3. RGB decimation X /2, Y /4

Using the same decimation factor as the above scenario for RGB pixels, but using YUV420 source buffers, it can be shown that the decimation factor for the Y and UV components of data are decimated differently. This is due to the pre-decimation of the chroma samples in the source frame buffers. Figure 4: YUV420 decimation X /2, Y /4 indicates that the U/V samples in the X direction are not decimated, but the Y samples in the X direction are decimated by the factor of 2.

Figure 42-4. YUV420 decimation X /2, Y /4

42.3.4 Bilinear Image Scaling Filter

The PXP implements a bilinear scaling filter to resize an input image to a different resolution for display output.

The bilinear filter is a weighted average of the four nearest pixels that can be sourced to approximate the pixel in the output frame buffer.

When scaling YUV data, the UV values are offset by 0x80 (top bit inverted) to shift the signed UV bits into an unsigned equivalent with a range of 0 to 255. YCbCr data does not have to be shifted since it is defined as an unsigned byte. The REG_CSC1_COEF0[YCBCR_MODE] bit controls whether this operation is applied to the input UV bytes.

After scaling, the offset is removed so that the range for UV data is signed from -128 to 127.

The reason for this adjustment is based on the implementation of an unsigned scaling engine, and therefore, is to ensure that the scaled values are handled properly. Consider the following table:

Format	pixel0	pixel1	average	Result
decimal	-2	+2	0	Correct
CbCr	0x7E	0x82	0x80	Correct (0x80 is 0 in CbCr)
UV	0xFE	0x02	0x80	Incorrect (0x80 is -128 in UV)
decimal	-32	+16	-8	Correct
CbCr	0x60	0x90	0x78	Correct (0x78 is -8 in CbCr)
UV	0xE0	0x10	0x78	Incorrect (0x78 is +120 in UV)

To compute the output pixel value at position as indicated by P, consider the diagram below.

Figure 42-5. Output Pixel Value

A step function is used to indicate the position of the pixel "P" in the output frame. This position may not coincide with a single pixel position in the input frame buffer. In this case, the four closest pixels in the input frame are used to approximate the value of the pixel in the output frame.

The PXP scaler first computes a linear filter in the X axis to create the two intermediate pixel values P_{x0} and P_{x1} . The step function's X fractional component is used to provide the weighting factor for blending p_{00} with p_{10} to provide P_{x0} . Likewise, P_{x1} is also derived from a linear filter using p_{01} and p_{11} .

The equations for P_{x0} and P_{x1} are as follows:

$$P_{x0} = p_{00} * (1 - R_x) + p_{10} * R_x$$

$$P_{x1} = p_{01} * (1 - R_x) + p_{11} * R_x$$

The PXP scaler uses the intermediate X pixels P_{x0} and P_{x1} and implements a bilinear filter on these two pixel values to produce the final pixel value at position P. The remainder of the step function for the Y axis is used to compute the weighted average pixel result. The equation for final filtered pixel is:

$$P = P_{x0} * (1 - R_y) + P_{x1} * R_y$$

42.3.5 YUV 4:2:2 Image Scaling

The following figure illustrates the positioning of YUV samples for the 4:2:2 formats. There are twice as many Y luma samples then U and V chroma samples horizontally.

Figure 42-6. YUV Sample Positioning, 4:2:2

Consider the scaled output pixel P_s (pixel scaled) which has an accumulated step function of $X=1.5$ and $Y=0.5$. The remainder for the step function is $R_x = 0.5$ and $R_y = 0.5$. Or, the sub pixel position of output pixel P_s is half way between line 0 and 1 and half way between column 1 and 2.

The Y output component of P_s is simply the bilinear function of the four nearest Y samples from the input image. Specifically, the Y values at [1,0], [2,0], [1,1], and [2,1] are used to compute the Y for P_s .

For the U and V components of P_s , there are no samples present in the column position 1. The bilinear filter uses chroma components located at [0,0], [2,0], [0,1] and [2,1]. Since the chroma components are not sub sampled vertically, the remainder used to combine pixels vertically is $R_y=0.5$ (the same as for Y). However, horizontally, the scaling engine shifts the remainder by a factor of 2. So an X axis step function value of $X=1.5$ has a remainder $R_x=0.75$. Source chroma values are not replicated, they are completely interpolated using the four nearest chroma samples to approximate U and V at P_s .

42.3.6 YUV 4:2:0 Image Scaling

The following figure illustrates the positioning of YUV samples for the 4:2:0 formats. Chroma is sub sampled both horizontally and vertically. In this format, the chroma frame buffers contain $\frac{1}{4}$ the data that the luma frame buffers store.

Figure 42-7. YUV Sample Positioning, 4:2:0

The Y output component for all scaled pixels in 4:2:0 formats are the same as for the 4:2:2 pixel formats.

The U and V output components have two considerations when computing the output pixel Ps.

1. All chroma samples from the input source image are shifted left and up by $\frac{1}{2}$ a sample position of the input pixel matrix.
2. Odd scan lines are replicated using the previous even chroma scan line values. So, output image chroma values that map between even to odd scan lines are replicated in the vertical axis. In contrast, output image chroma values between odd to even scan lines are interpolated vertically.

The chroma values are interpolated horizontally as in the 4:2:2 pixel format.

As an example, consider the interpolated pixel Ps in the 4:2:0 diagram above. For the Y component, the interpolated output luma is a function of the Y values in the source frame buffer at position [1,0], [2,0], [1,1], [2,1].

For the U and V interpolated samples, the chroma values on scan line position 0.5 are shifted so that they coincide with the even luma sample points. They are also replicated so that a single chroma scan line is used twice. The chroma scan line at 0.5 is replicated to represent the 4:2:2 sample points for scan line 0 and 1. The chroma scan line at 2.5 is replicated to represent the 4:2:2 sample points for scan line 2 and 3. This pattern of chroma replication occurs for the entire source frame buffer during the scaling operation.

Figure 42-8. Scaled Chroma Computation Examples

The preceding diagram has two examples for the computation of the scaled chroma output pixel. For chroma at output position PsA (vertical position 0.5), interpolation occurs in the X axis using chroma values at column 0 and column 2. However, since line 0 and line 1 have equal chroma values due to chroma line replication, scaling in the Y axis results in replication of chroma values.

For chroma at output position PsB (vertical position 1.5), interpolation occurs in both the X and Y axis. The Y axis is an interpolation since the chroma values copied to scan line 1 and 2 and not the same.

In summary, any output image pixels that map to an odd scan line above and an even scan line below are interpolated vertically. Output image pixels that map to an even scan line above and an odd scan line below are replicated vertically.

42.3.7 RGB/YUV444 Image Scaling

For all RGB formats, the RGB pixels are converted up to RGB888 with 8 bits per each color component.

Then each color component is passed to the scaling engine and each component is treated in the same manor. The RGB scaling operation is the same as for the Y scaling operation described in the preceding sections. Also, YUV444 contains a byte for each color plane at each pixel location, so all three color components are scaled in the same manor.

42.3.8 Color Space Conversion (CSC)

There are two modules in the PXP to convert pixels between color spaces. They are referred to as CSC1 and CSC2.

CSC1 exists after the scaling unit and is dedicated to converting from YUV to RGB. CSC2 is a full duplex color space converter in that it can convert into either RGB or YUV (or YCbCr) color spaces depending on the desired output pixel format. All coefficients are programmed as two's complement numbers and both CSC units can be bypassed if CSC is not desired at either position of these CSC units in the pixel data path.

42.3.9 CSC1 Operation

The CSC1 module receives scaled YUV/YCbCr444 pixels from the scale engine and converts the pixels to the RGB888 color space only if CSC1 is enabled.

The CSC1 module will convert only to the RGB color space and it can be bypassed to allow YUV pixels through the data path. These pixels are loaded into the pixel FIFO for processing by subsequent modules in the pixel data path.

The following equations are used to perform YUV/YCbCr -> RGB conversion. The constants will be stored in the PXP control registers as two's complement values to allow flexibility in the implementation and to allow for differences in the video encode and decode operations. In addition, this provides a software mechanism to manipulate brightness or contrast.

$$R = C0(Y+Yoffset) + C1(V+UVoffset)$$

$$G = C0(Y+Yoffset) + C3(U+UVoffset) + C2(V+UVoffset)$$

$$B = C0(Y+Yoffset) + C4(U+UVoffset)$$

Note: In the equations above, U and V are synonymous with Cb and Cr in regards to the color space format of the source frame buffer.

Saturation of each color channel is checked and corrected for excursions outside the nominal YUV/YCbCr color spaces. Overflow for the three channels are saturated at 0x255 and underflow is saturated at 0x00.

The table below indicates the expected coefficients for YUV and YCbCr modes of operation:

Coefficient	YUV	YCbCr
Yoffset	0x000	0x1F0 (-16)
UVoffset	0x000	0x180 (-128)
C0	0x100 (1.00)	0x12A (1.164)
C1	0x123 (1.140)	0x198 (1.596)
C2	0x76B (-0.581)	0x730 (-0.813)
C3	0x79B (-0.394)	0x79C (-0.392)
C4	0x208 (2.032)	0x204 (2.017)

42.3.10 YUV versus YCbCr Support

By default, the PXP color space coefficients are set to support the conversion of YUV data to RGB data.

If YCbCr input is present, software must change the coefficient registers appropriately (see the register definitions for values). Software must also set the YCBCR_MODE bit in the COEFF0 register to ensure proper conversion of YUV versus YCBCR data.

42.3.11 CSC2 operation

The CSC2 module receives pixels in any color space and can convert the pixels into any of RGB, YUV, or YCbCr color spaces.

All coefficients are programmable and in the two's complement notation. The output pixels are passed onto the LUT and rotation engine for further processing.

The following equations indicate the CSC2 modules ALU architecture.

Selecting RGB output in REG_CSC2_CTRL[CSC_MODE] configures the ALU in the following manor:

$$R = A1(Y-D1) + A2(U-D2) + A3(V-D3)$$

$$G = B1(Y-D1) + B2(U-D2) + B3(V-D3)$$

$$B = C1(Y-D1) + C2(U-D2) + C3(V-D3)$$

Selecting YUV output configures the ALU in the alternate manor:

$$Y = A1*R + A2*G + A3*B + D1$$

$$U = B1*R + B2*G + B3*B + D2$$

$$V = C1*R + C2*G + C3*B + D3$$

Saturation of each color channel is checked and corrected for excursions outside the nominal color space. Overflow for the three channels are saturated at 0x255 and underflow is saturated at 0x00.

42.3.12 Alpha Blending/Color Key

Regardless of pixel input format, the PS and AS pixels are normalized to 32-bits, organized as one alpha and three data bytes.

Alpha blending occurs in the RGB space, if blending is required, PS pixels should be converted to RGB space. If no alpha blending is required, then YUV pixels can bypass the alpha blending ALU without color space conversion.

All pixels are processed by the pixel ALU, but the ALU operations can be disabled to achieve pixel pass through for either PS or AS or fetch data channels source pixels.

42.3.13 Alpha Blend

There are two alpha blend modes in this module. First is the normal blending mode using single alpha parameter. Second is the porter-duff blending mode used in 2D. Both modes alpha blend modes are described in the sub-sections below.

42.3.13.1 Normal Alpha Blend

The alpha value for an individual pixel represents a mathematical weighting factor applied to the AS pixel. An alpha value of 0x00 corresponds to a transparent pixel and a value of 0xFF corresponds to an opaque pixel.

The effective alpha value for an AS pixel is determined by the REG_AS_CTRL[ALPHA] and REG_AS_CTRL[ALPHA_CTRL] register fields. If REG_AS_CTRL[ALPHA_CTRL] = ALPHA_OVERRIDE, the alpha value for the pixel is taken from the REG_AS_CTRL[ALPHA]. This can be useful for applying a constant alpha to an entire image or for image formats that don't include an alpha value. If REG_AS_CTRL[ALPHA_CTRL] = ALPHA_MULTIPLY, the pixel's alpha value will be multiplied by the pixel's ALPHA value in order to allow scaling of the pixel's alpha or to provide better control for pixel formats such as RGB1555, which only contains a single bit of alpha.

For each color channel, the equation used to blend two source pixels is defined below:

$G\alpha$ = PIO programmed global alpha (8-bit value).

$E\alpha$ = Embedded alpha associated with AS pixel.

$$\hat{\alpha} = G\alpha * E\alpha + 0x80$$

The result for the red channel as an example:

$$R[7:0] = (\hat{\alpha} * PS.r) + ((1 - \hat{\alpha}) * AS.r)$$

When α is 0xff, the PS pixel will not be blended with the AS pixel, but PS will be passed as the output pixel and will not be blended with AS. In this case, AS will be discarded. Likewise, if α is 0x00 for a given pixel, PS will be loaded as the output pixel.

REG_AS_CTRL[ALPHA_INVERT] provides the option to invert the final alpha value. This essentially inverts the effect the alpha value has on the AS and PS blending operation.

42.3.13.2 Porter-Duff Alpha Blend

Porter-Duff blend includes 12 blending modes to describe digital image composite. These processes include Clear, Source Only, Destination Only, Source Over, Source In, Source Out, Source Atop, Destination Over, Destination In, Destination Out, Destination Atop and XOR. Through these process it can achieve any 2D image composite.

To control the blending modes, please see below picture. All the registers showed below are included in HW_PXP_ALPHA_A_CTRL.

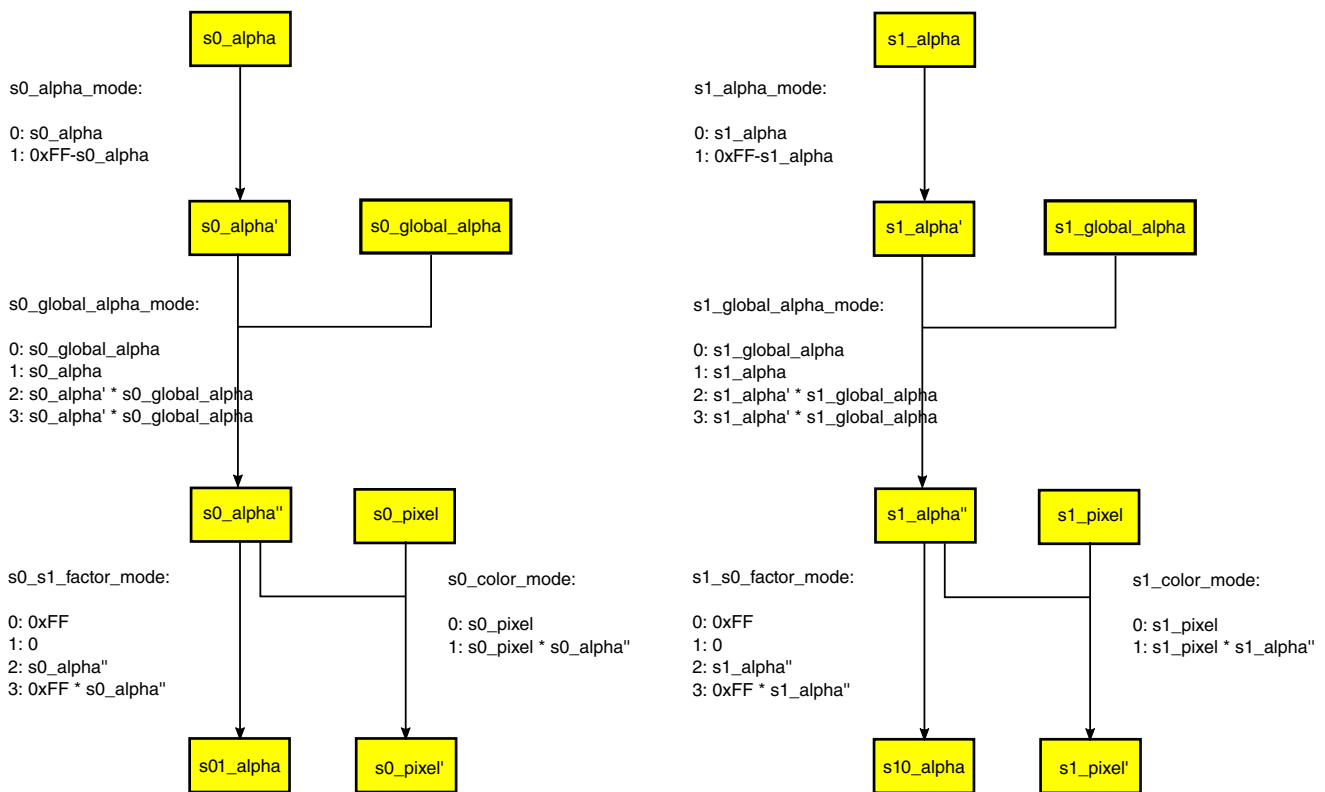

Figure 42-9. Porter-Duff Alpha Blend

42.3.14 Color Key

The color key function is provided to create transparent effects on the output pixel.

Color keying is applied on the input pixels after they are converted to 8-bits for each red, green, and blue color channels (color keys are not applied directly to 16-bit pixel formats but to their corresponding 24-bit representation). A color key range is programmable for both PS and AS pixels. If the PS 24-bit pixel is within the PS color key range, then AS is passed through the pixel pipeline. In this case, alpha blending does NOT occur.

Conversely, if PS is within the AS color key range, then PS is passed via the PXP data pipeline. If both PS and AS color key tests pass, then the back ground color register is passed onto following PXP processing components in the pipeline.

The condition for color keying to be satisfied is:

$$CK0.r.low \leq PS.r \leq CK0.r.high$$

$$CK0.g.low \leq PS.g \leq CK0.g.high$$

$$CK0.b.low \leq PS.b \leq CK0.b.high$$

For example, if the "red" 8-bit value for the PS pixel (or PS.r) is between the color key low and high values (CK0.r.l and CK0.r.h), the condition is true for the red color plane. When ALL three color planes meet this condition, then only the PS pixel is loaded into the output register.

To disable color keying, program the low color key register value to 0xff and the high value to 0x00. This will guarantee that the color key range test will never be true.

42.3.15 LUT

The lookup table (LUT) is used to modify pixels in a manner that is not linear and that cannot be achieved by the color space conversion modules.

Nonlinear response to the input pixels can be achieved based on how the lookup table is programmed.

Programming of the direct access LUT table can be facilitated by single PIO register writes or DMA access. For efficient loading of the LUT, DMA access should be used.

42.3.16 Lookup Modes

The LUT has four lookup modes. The lookup modes determine how the src_pixel is used to address the LUT memory.

The four lookup modes are:

1. DIRECT_Y8
2. DIRECT_RGB444
3. DIRECT_RGB454
4. CACHE_RGB565

The DIRECT modes access the LUT memory as a monolithic SRAM. The CACHE_RGB565 will access the memory as a 2-way set associative cache.

42.3.17 DIRECT_Y8

DIRECT_Y8 is used for a 256-byte lookup. In DIRECT_Y8, the most significant byte of the pixel is used to address the LUT entry.

This byte reflects the Y/R channel of the pixel data path. Luma, or monochrome, transformations are possible with this lookup mode. The address is generated as: `src_pixel[23:16]`. In DIRECT_Y8 operation, the memory is byte addressable.

42.3.18 DIRECT_RGB444

DIRECT_RGB444 is used for a 8KB (4K pixel) RGB444 to RGB565 lookup.

Pixel formats that are in the YUV color space at the position of the LUT in the PXP data path can also be converted. To take advantage of the full 16KB memory, the `REG_LUT_CTRL[SEL_8KB]` bit can be used to select the upper or lower 8KB memory, thus facilitating the use of 2 separate 444 LUT tables. In DIRECT_RGB444, the `src_pixel` is RGB/YUV[23;0] data is used to generate the lookup address. The address is generated as: `{R/Y[23:20],G/U[15:12],B/V[7:4]}`. In DIRECT_RGB444, the memory is pixel (2 byte) addressable.

42.3.19 DIRECT_RGB454

DIRECT_RGB454 is used for a 16KB (8K pixel) RGB454 to RGB565 lookup.

Pixel formats that are in the YUV color space at the position of the LUT in the PXP data path can also be converted. In DIRECT_RGB454, the `src_pixel` is RGB/YUV[23;0] data is used to generate the lookup address. The address is generated as: `{R/Y[23:20],G/U[15:11],B/V[7:4]}`. In DIRECT_RGB454, the memory is pixel (2 byte) addressable.

42.3.20 CACHE_RGB565

The CACHE_RGB565 lookup is used for a 128KB (65K pixel) RGB/YUV565 to RGB/YUV565 lookup.

The 128KB memory requirement is too costly from an area perspective to implement a complete lookup table in the LUT's on chip memory. For this reason, a LRU (least recently used) 16KB 2-way set associative cache has been implemented to reference the full 128KB lookup table stored in external memory.

The 2-way set associative cache is organized in the following way:

- 16KB total data storage
- 512 entries split between 256 ways
- 6 pixels/entry cache line

Cache efficiency is very critical. For a cache miss, the PXP will be stalled until the cache line can be filled. For a 32 bit DDR memory interface, the latency can be calculated as follows:

cycles latency for read command through DDR controller + CAS Latency + # burst cycles for read data to be returned + # cycles latency for data through DDR controller to LUT + 1 cycle for cache access of new data

The src_pixel is RGB[23:0] data used to generate the lookup address. To improve the cache efficiency the RGB/YUV565 address and the lookup table must be formatted in the following way:

Address: $A[15:0] = R_7G_7G_6B_7 R_6G_5B_6 R_5G_4B_5 R_4G_3B_4 R_3G_2B_3$

The address is organized as follows:

- A[15:12] tag address, used to compare a hit between cache ways
- A[11:4] index address, used to select cache set (i.e. row of memory)
- A[3:0] block address, used to select Pixel in the cache line

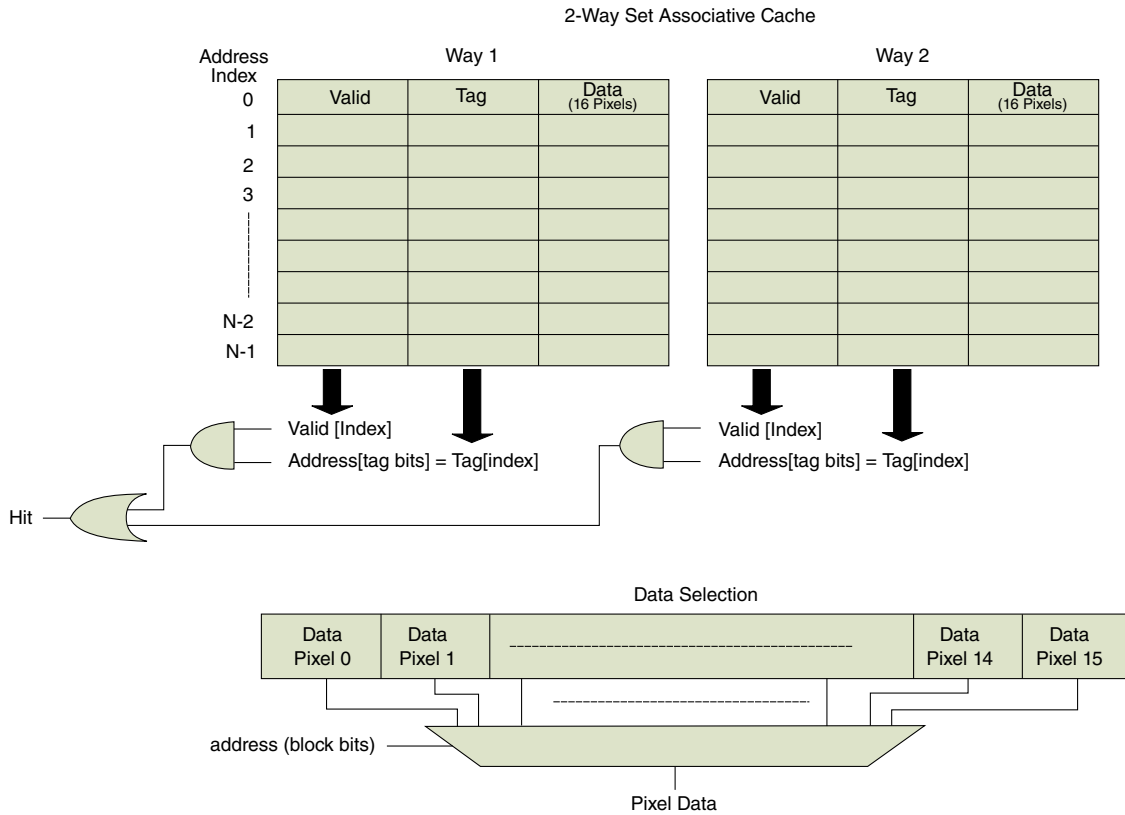

Figure 42-10. 2-Way Set Associative Cache and Data Selection

42.3.21 Output Modes

The LUT has three output modes for color space conversion.

1. Y8
2. RGBW4444CFA
3. RGB888

42.3.22 Y8

With `out_mode` set to Y8, in conjunction with DIRECT_Y8 lookup mode, the intended operation is Gama Correction.

Only the third byte is processed by the lookup table. The third byte is represented by the Y value or the R value in the data path since pixel data is either YUV[23:0] or RGB[23:0] where the Y or R byte encompass bits [23:16] respectfully. So, bits 15:0 are

always bypassed and left unchanged. Currently, the LUT is intended to process Y data when any YUV, Y8, or Y4 output pixel formats are selected. However, this resource can be enabled and used for any conceivable purpose.

Note: When the DIRECT_RGB444, DIRECT_RGB454 or CACHE_RGB565 lookup mode is selected in conjunction with the Y8 output mode the low order byte of the two bytes read from the LUT memory will be used as the Gama Correction value.

42.3.23 RGBW4444CFA

With REG_LUT_CTRL[OUT_MODE] set to RGBW4444CFA, the REG_CFA[DATA] is used to select one nibble from the LUT 16 bit output value.

The LUT memory lookup will contain a RGBW4444 value. The REG_CFA[DATA] will select the R,G,B or W nibble as the pixel value to present to the PXP data path based on the matrix defined by the REG_CFA[DATA] register. The 4 bit value is presented in the Y, or third byte lane, of the PXP data path. The final pixel transferred to the next PXP stage is {CFA[3:0],CFA[3:0],LUT[15:0]}

42.3.23.1 CFA Correction

The 32-bit REG__CFA[DATA] register is used to encode 16 CFA correction values.

The CFA correction values are encoded as follows:

- 00 selects R
- 01 selects G
- 10 selects B
- 11 selects W

The CFA correction uses 4x4 block processing. Figure 5; CFA mapping translation shows how CFA 4x4 blocks will iterate over the PXP's 8x8 or 16x16 pixel block being processed:

Figure 42-11. CFA mapping translation

42.3.24 RGB888

With `out_mode` set to RGB888, the memory output data is interpolated from RGB565 to RGB888.

The RGB[23:0] data is formatted as follows: R[7:3]R[7:5],G[7:2]G[7:6],B[7:3]B[7:5].

42.3.25 Rotation

Rotation can occur after compositing the AS and PS buffers in the output stage.

To rotate graphics, the hardware must read pixels in one direction across a frame buffer and write them in an alternate orientation. For the 90 and 270 degree cases, this means that lines of pixels must either be read or written vertically in a frame buffer.

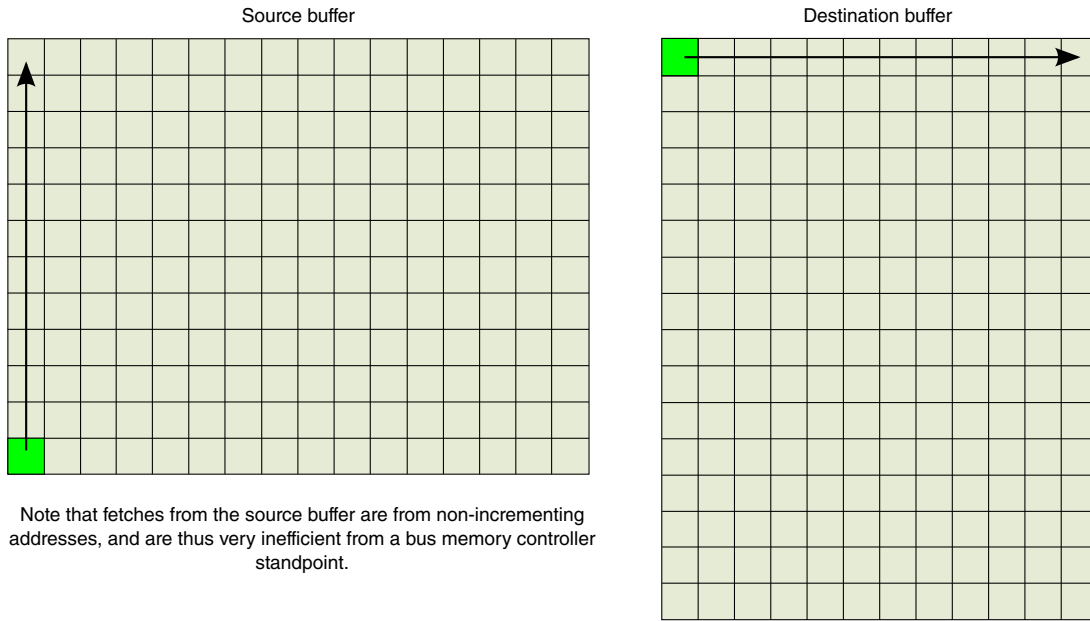

Figure 42-12. Rotation Read and Write

In order to rotate efficiently, multiple columns must be rotated to enable the engine to both fetch and store bursts of pixels, thus improving memory performance. The simplest method of doing this is to operate on square blocks of pixels. To rotate the image, each sub-block of pixels must be rotated by the required rotation angle.

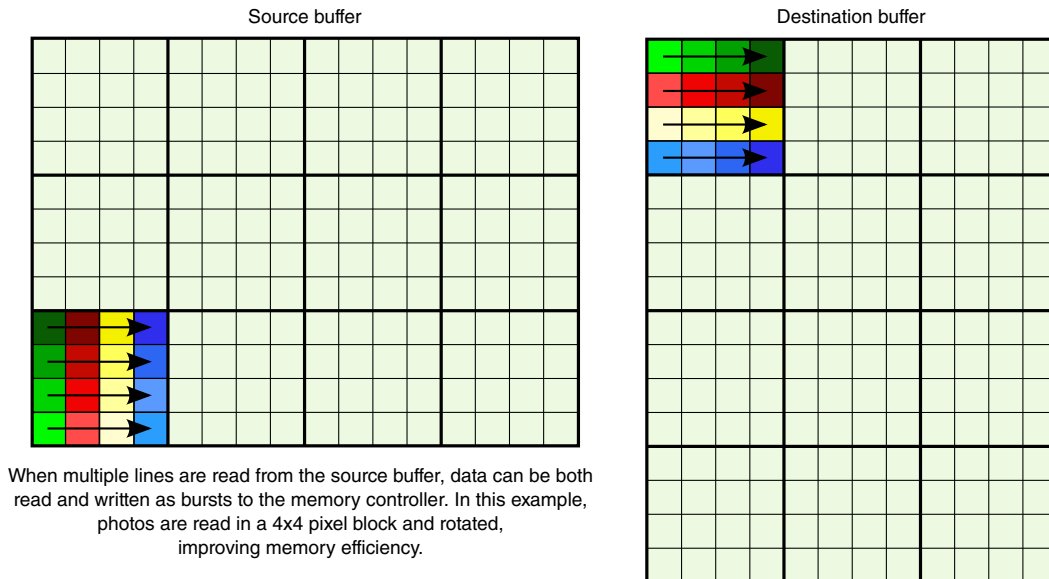

Figure 42-13. Rotated Sub-blocks

To manage the rotation process, the source image can be broken into a grid of sub-blocks that have coordinates as shown in the diagram below. In addition to rotating the sub-block, each block must be translated to a new coordinate location. For each of the rotation angles (0, 90, 180, 270), it is possible to define a simple algorithm for computing the new translated grid address. The hardware must then simply compute the memory address from the base grid address for both load and store operations.

Figure 42-14. Grid of Sub-Blocks with Coordinates

In order to balance the requirements of reasonable burst sizes to the memory controller as well as keep the hardware storage requirements to a minimum, the blending/rotation engine will operate on either 8x8 or 16x16 pixel blocks. When using the Rotate engine with the input fetch engine, you need to program the input fetch engine to work in 8x8 block mode.

NOTE

An important artifact of the PXP is when rotating a source image and the output is NOT divisible by the block size selected. The output engine essentially truncates any output pixels after the desired number of pixels has been written. Since the output buffer is written as a horizontal row of blocks, the incorrect pixels could be truncated and the final output image can look shifted. In the case where the block size is programmed to 8x8, and the output size that is programmed is 12x12, then there is a remainder of 4 pixels that will be truncated in either the X and/or Y axis when the PXP operation

is complete. The output will be shifted by 4 pixels in this example. To compensate for this, the source base address needs to be adjusted so the correct pixels get truncated and the image does not look shifted. In this example, with 90 degrees of rotation, the PS base address should be adjusted by 4 times the actual PS base address $-(4 * \text{pitch})$.

42.3.26 Output Buffer

The output buffer engine accepts data from the PXP pixel pipeline and issues requests to transfer the output pixels to external DRAM or the internal SRAM double buffer row of blocks.

42.3.27 Address calculator

Each of the blocks will manage its own fetch address using a common address calculator block that computes real addresses from a base address and relative block offset from the base.

Each block will then perform the multiple line fetches (or stores) required to perform the operation. This hides all the address buffer computations from the processing blocks and allows each block to simply track the coordinate of the block it is working on.

42.3.28 Block size selection

The PXP can be configured to process blocks that are either 8x8 pixels or 16x16 pixels with the REG_CTRL[BLOCK_SIZE] control bit.

When selecting a 16x16 pixel block size, the accesses to fetch AS and PS images and write the final frame buffer are more efficient since twice as much data is requested and processed per memory request.

When optimizing the system for memory bandwidth and image processing time, configure the PXP to process 16x16 pixel blocks.

42.3.29 Interlaced Video Support

The PXP has some minimal ability to generate interlaced video content from a progressive source. There two available options, based on the bandwidth requirements and how software is managing video frames.

The PXP can either interlace on the input side (by reading every other line of input data) or on the output side (by writing the individual lines of video into two separate fields). Generally, output interleaving should be used since it is the most flexible mode (it allows scaling and full overlay support) and it only requires a single pass of the PXP to generate two separate output fields.

Input interleaving can be beneficial in cases where the PXP is running at 60fps, since it requires fewer fetches to produce the output data. There is no direct hardware support for input interleaving, in that, there is no configuration bit that can be set to alter how the PXP processes a frame for input interleaving. Input interleaving is achieved by simply setting the source frame buffer pitch value to twice the value it would normally be set to for the equivalent progressive frame. The output parameters also need to be consistent with the desired processing effect. For example, the vertical resolution would be set to account for the reduced resolution to process the interlaced input buffers.

42.3.30 LCDIF Handshake

The PXP and LCDIF support a mode where the internal SRAM can be used for the frame buffer to minimize external memory bandwidth required.

This is accomplished by creating two buffers in SRAM, a double buffer row of blocks, where each correspond to 8/16-lines of the frame buffer. The buffers must be consecutive and allocated as a single block of data.

Figure 42-15. Buffer in OCRAM

The storage required can be calculated for an 8x8 block size as

- storage = 16 (lines) * rotated_row_length * pixel_size

and for 16x16 block size as

- $\text{storage} = 32 \text{ (lines)} * \text{rotated_row_length} * \text{pixel_size}$

where $\text{pixel_size} = 4$ for 32bpp or 2 for 16bpp modes. The following table lists the storage requirements for common image sizes using 8x8 block size:

Image Size	Storage (16bpp)	Storage (24bpp)	Storage (32bpp)
320x240 (QVGA) - 0/180 rotation	10KB	15KB	20KB
320x240 (QVGA) - 90/270 rotation	7.5KB	11.5KB	15KB
640x480 (VGA) - 0/180 rotation	20KB	30KB	40KB
640x480 (VGA) - 90/270 rotation	15KB	22.5KB	30KB

The following diagram shows how the minimal rotation buffer would be organized. As the engine and LCD progress down the image, they continually swap roles of filling and emptying each eight-line buffer.

Figure 42-16. Minimal Rotation Buffer Organization

When this mode is enabled, the PXP will process one row of pixel blocks and write the results to the first SRAM buffer (buffer 0). The PXP will then alternate between writing subsequent rows to buffer 0 and buffer 1. After the PXP generates the data for one buffer, the LCDIF will begin reading that buffer and send the contents to the display device. Once the LCDIF finishes reading a buffer, it will start displaying from the other buffer while the PXP continues filling the previously processed buffer.

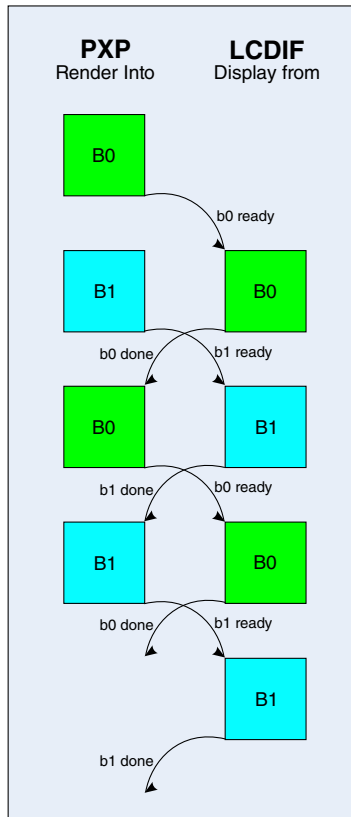

Figure 42-17. PXP and LCDIF Buffer Sharing

To accomplish the buffer sharing, the PXP and LCDIF will maintain buffer status using a pair of handshake signals. When a buffer is filled by the PXP, it will assert the `pxp_lcdif_bx_ready` (where `x` is 0 or 1) signal to indicate to the LCDIF that the buffer has valid data. The LCDIF will then release the buffer by asserting the `lcdif_pxp_bx_done` signal.

The basic protocol is shown in the diagram below:

Figure 42-18. Buffer Sharing Protocol

The PXP will continue to assert the `bx_ready` signal until the corresponding `bx_done` signal is sampled high for one clock cycle. It will then deassert the `bn_ready` until the next time the buffer has been filled. After the PXP samples the `bx_done` signal asserted, it is free to begin filling the buffer with the next block size lines of display data. If a buffer has not been released when the PXP is ready to process data for that buffer, it will suspend rendering operations until the buffer has been released by the LCDIF.

42.3.31 LCDIF Abort

When the memory subsystem is not loaded, the PXP should be able to render the buffers faster than the LCDIF can drain the buffers.

It is possible under some scenarios (high LCDIF output rates with high memory latency) that the PXP may not be able to keep up with the LCDIF, even in the SRAM mode of operation. When this happens, the LCDIF will signal that it has completed one of the buffers before the other has been rendered by the PXP. This condition will be detected by the PXP's control logic as an "LCDIF Abort", which will cause the PXP to abort processing in the current row and proceed to the following row. It will acknowledge the abort to the LCDIF by raising the `buffer_ready` signal for the current buffer to enable the LCDIF to begin displaying the partially-filled buffer. While an abort will create artifacts in the video display, it does minimize the artifacts by limiting them to the remaining pixels blocks in the current row versus ruining the entire frame buffer.

Figure 42-19. LCDIF Abort

42.3.32 Theory of Operation

The PXP can be used to accelerate graphics operations by offloading graphics processing from the processor. The block can perform alpha blending and color key substitution on two RGB graphics buffers.

The PXP is organized as having a processed surface (PS) and an alpha surface (AS) that can be blended with the processed surface. There are no restrictions on the location of the AS or PS within the output surface (OS). As the PXP processes NxN blocks, operations

are performed on a pixel by pixel basis. The AS and PS pixels are alpha blended, color keyed, process by CSC and LUT resources as individual pixel components. This allows efficient block processing with supporting arbitrary alignment for both the AS and PS surfaces. The resulting pixel block is then written to the corresponding block in the output buffer.

42.3.33 Pixel Handling

All pixels are internally represented as 32-bit values regardless of input or output pixel formats.

The pixels get converted in the AS and PS buffer engines to 24-bit pixel values. There is also an 8-bit alpha value at stages up to the alpha blender within the PXP for blending within the RGB color space. Compositing of AS and PS images can only occur in the RGB color space. If compositing is not required, then YUV pixels can be transferred and processed at all PXP pixel resource components.. The color orientation of pixels within the PXP can be controlled by the CSC1, CSC2, and LUT resources.

For RGB, input pixels are converted into 22-bit pixel values using the following rules for both AS and PS:

1. 32-bit ARGB8888 pixels are read directly with no conversion.
2. 32-bit RGB888 pixels are assumed to have an alpha value of 0xFF (full opaque).
3. 6-bit RGB565 and RGB555 values are expanded into the corresponding 24-bit color space and assigned an alpha value of 0xFF (opaque). The expansion process replicates the upper pixel bits into the lower pixel bits (for instance a 16-bit RGB555 triplet of 0x1F/0x10/0x07 would be expanded to 0xFF/0x84/0x39).
4. 16-bit RGB1555 values are expanded into the corresponding 24-bit color space and assigned an alpha value of either 0x00 or 0xFF, based on the 1-bit alpha value in the pixel. The ALPHA_MULTIPLY function is useful in this scenario to allow scaling of the opaque pixels to a semi-transparent value.

Alpha values can be passed through the entire PXP data path and output in ARGB888 and ARGB555 pixel modes. Also, output pixels can be assigned an alpha value using the REG_OUT_CTRL[ALPHA] register. 16-bit pixels values are formed from the most significant bits of the 24-bit pixel values.

When YUV/YCbCr output formats are selected, all pixels are internally represented as either RGB or YUV pixels values. The CSC2 or LUT can convert internal RGB/YUV pixels into the correct output format. In this way, any PS color space can be blended with AS RGB pixels and output in any color space.

42.3.34 Output Buffer Composition

The output buffer will be rendered by composing each pixel block from the associated PS and AS buffers.

The AS pixel buffer can be blended or color-keyed with the associated data from the PS buffer (either the PS image pixels or REG_PS_BACKGROUND register based on PS programmed coordinates).

Figure 42-20. Output Buffer Composition

42.3.35 PS Image Processing

As the PXP processes image buffers, it iterates over the output buffer by fetching the corresponding input buffer blocks and processing the pixels embedded in these.

42.3.36 Letterboxing

At each pixel coordinate, the control logic determines if the PS pixel (argument also applies to AS pixels) will be used in rendering the output pixel.

This is determined by checking the output pixel's coordinates against the REG_OUT_PS_ULC and REG_OUT_PS_LRC (ULC and LRC in short) register contents. For pixels outside this region, the PS pixel will be loaded with the pixel value from REG_PS_BACKGROUND, which can be used to effectively control the letterboxing color. There are no block size or block boundary restrictions when setting the ULC or LRC for either the AS or PS. The only restriction is that the ULC and LRC are within the OUT LRC extents.

Figure 42-21. OUT Buffer

42.3.37 Clipping source images

A subset of the PS buffer can be used in rendering the output buffer. The PXP_PS_BUF register can indicate an offset into the PS buffer that will be used for display within the OUTPUT buffer.

The pixel at the address defined in the PXP_PS_BUF register will be the pixel that is displayed at the pixel coordinate indicated by PXP_OUT_PS_ULC within the output buffer. Essentially, the PXP_PS_BUF register can be used to establish an offset into the PS buffer thus clipping all PS buffer pixels that are at a lower address. The PXP_PS_PITCH will always indicate the number of bytes that are vertically adjacent in

the PS buffer. The settings in the PXP_PS_BUF, PXP_OUT_PS_ULC, and PXP_OUT_PS_LRC will determine the subset of the PS buffer, or clipped PS source buffer, that will be used in the output buffer.

It is important to note that when scaling the PS buffer, the coordinates of the PS buffer within the output buffer need to be consistent with the scaling factors and original PS buffer size.

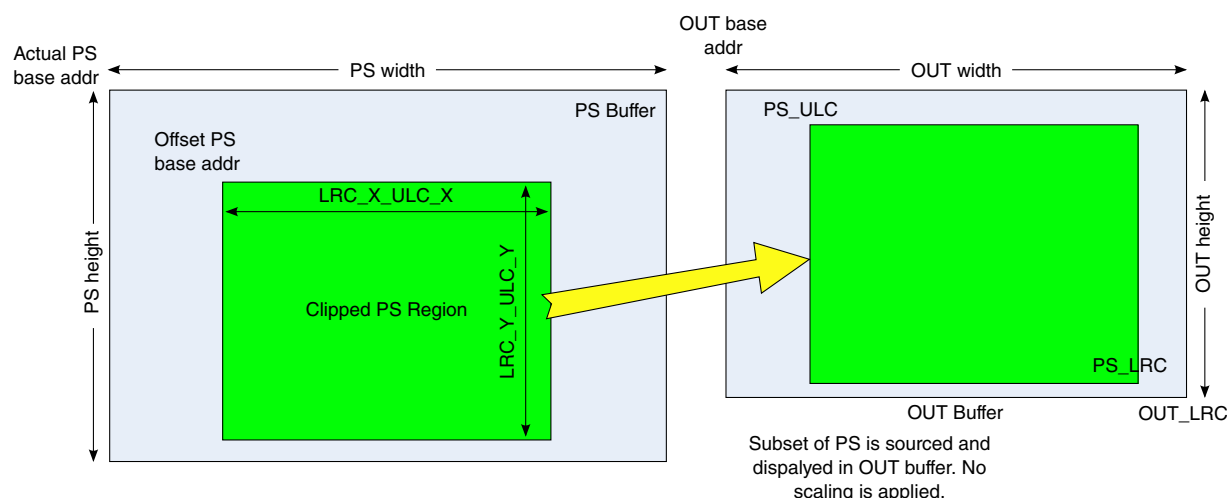

Figure 42-22. PS Buffer Scaling

When sourcing a subset of the PS image, it should fall completely within the PS buffer to avoid displaying incorrect data. The following conditions should be met:

$$x_base_addr_offset + x_scale * (LRC_X - ULC_X) \leq PS_pitch$$

$$y_base_addr_offset + y_scale * (LRC_Y - ULC_Y) \leq PS_size$$

The PXP hardware does not check for these conditions and will render the image as programmed. The following case could indicate invalid programming parameters for the PXP:

Figure 42-23. Example with Invalid Parameters

42.3.38 Color Key Processing

Pixels may be made transparent to the corresponding AS by using the PS color key registers.

If a PS pixel matches the range specified by the REG_PS_COLORKEYLOW and REG_PS_COLORKEYHIGH registers, the pixel from the associated AS will be displayed. If no AS is present for the pixel, a black pixel will be generated since the default AS pixel is 0x00000000 (transparent black pixel).

The most common use for this is when a bitmap does not support an alpha-field or for applications such as "green screen" where an image is substituted for a solid background color .

Figure 42-24. The PS image (player) and AS image (stadium)

The green portion of the background image can be color keyed to display the contents of the AS buffer for locations that match the color range. For this example, the color range is:

PS Colorkey: 00<R<80 70<G<ff 00<B<80

The resulting image becomes:

Figure 42-25. Resulting Image

42.3.39 In Place Processing (PS buffer is destination buffer)

The PXP also has the ability to process an image and write the resulting buffer back to the original PS buffer. This is referred to as "in place" rendering.

This could be useful for basic blit operations into the PS buffer. IN_PLACE operations are achieved by programming the OUT base address to the pixel location in the PS buffer that marks the upper left pixel of the update region. The actual region that is updated should be indicated by programming the ULC = (0,0) and the LRC = (X,Y). The region bounded by the coordinates will be updated, and the rest of the PS buffer will not be modified.

42.3.40 Alpha Surface (AS) Processing

The AS surface has a complete set of registers that determines how the AS effects the final OUT surface.

Most of the registers that exist for the PS surface also are defined for the AS surface where applicable. This is provided to replicate the SW interface for each PS and AS processes.

42.3.41 Alpha Handling

Alpha values in the AS are embedded in the source image pixels. For AS pixel formats that do not support an alpha value, the pixel is assigned an alpha value of 0xFF (opaque).

This can be modified by the AS control by setting either the ALPHA_MULTIPLY or ALPHA_OVERRIDE bit in the associated AS_CTRL register. If ALPHA_MULTIPLY is enabled, the 8-bit ALPHA value from the AS_CTRL register is multiplied by the source alpha before blending with the PS image. If the ALPHA_OVERRIDE bit is set, the 8-bit ALPHA value is simply substituted for the pixel.

42.3.42 Color Key Processing (AS_CTRL)

The AS_CTRL register also contains an ENABLE_COLORKEY bit that can be used to enable or disable color key substitution for the AS.

When enabled, the pixel values are compared to the ASCOLORKEYLOW and ASCOLORKEYHIGH registers to determine if a match has occurred. When an AS pixel matches the color key range, the pixel from the AS image is considered transparent and the corresponding PS pixel is rendered. If both the PS and AS pixels match their corresponding color key ranges, the AS pixel is displayed unmodified.

AS color keys are handled in a manner similar to PS color keys. The same images used in the PS color key example could be used with the images swapped. In this case, matches on the AS image to the ASCOLORKEY register would display the PS pixels.

42.4 Output Image Processing

Several PXP options affect the resulting output image.

42.4.1 Output Image Size

The PXP generates an output image in the resolution programmed by the REG_OUT_LRC. As the PXP processes pixels, it iterates over the NxN blocks (in output scan-block order) based on the final image resolution.

42.4.2 Output Format

The result of PXP operations are written to the buffer pointed to by the REG_OUT_BUF/REG_OUT_BUF2 registers. The pixel format is controlled by the REG_OUT_CTRL[FORMAT] bit-field.

32-bit pixels are formed directly from the internal 24-bit representations and 16-bit pixel formats are generated by truncating the internal 24-bit values to the appropriate number of bits. For formats supporting an alpha value, the PXP assigns the alpha using the 8-bit value in the REG_OUT_CTRL[ALPHA] field. For ARGB1555, the most significant alpha bit is appended to the output pixel. Also, for ARGB4444, the most significant nibble is appended to the output pixel. Single and dual buffer YUV output formats are also available. Since each pixel in the data path is represented by a full YUV444 24bpp value, decimation reduces the output in cases of YUV422/420 output formats.

42.4.3 Rotation/Flip operations

The PXP supports four rotation angles in conjunction with vertical and horizontal flip options. The flip operations effectively take place before the rotation.

Rotations of 0, 90, 180, and 270 degrees are supported and any combination of rotation and flip are supported. There is no performance difference between any of these modes of operation.

42.5 Queuing PXP transactions

The PXP supports a primitive ability to queue up one operation while the current operation is running. This is enabled through the use of the REG_NEXT register.

When this register is written, it enables the PXP to reload its current register contents with the data found at the location pointed to by this address when it completes processing of the current frame. This feature may be useful in helping to reduce the interrupt latency in servicing the PXP, especially in cases where the PXP and LCDIF are using the on-chip SRAM buffer handshake (since the PXP must begin generating next frame data immediately).

If the PXP is idle when the REG_NEXT register is written, the PXP treats this as an indication that it should immediately load the values at the pointer and begin processing the frame. This ability should allow software to use the same routines when programming the PXP (so that the first frame doesn't differ from subsequent frames).

When loading values from the NEXT register, all registers in the PXP are reloaded. Some register loads have no effect

After writing the REG_NEXT register, the PXP will set the REG_NEXT[ENABLED] bit of the REG_NEXT register to indicate that the next command has been queued. Software should first check the status of this bit to ensure that a previous command has not been enabled. Likewise, after programming the first frame in a sequence of frames, software should poll this bit until it is sampled logic 1'b0 before queuing the next operation.

The PXP will issue interrupts from frames as they complete, regardless of whether they were started by writing the control registers directly or using the REG_NEXT register. When software receives an interrupt, it should check/clear the PXP's status register as normal, poll the REG_PXP[ENABLED] bit, and then issue the next operation. A queued operation may be cancelled by issuing a CLEAR operation to the REG_PXP[ENABLED] register bit. The SET and TOGGLE operations should never be used with this register.

42.6 Error Handling

The PXP does minimal checking on the control registers, so it is important that these are correctly specified. The PXP does monitor the bus transactions for errors and will report errors in the status register.

Upon receipt of a bus error, the PXP will set the ERROR interrupt and abort any further operations. Bus errors can be generated from any system access that results in an error response returned from the internal SIM Bus errors in the PXP are signaled as either a read or a write error, but do not indicate the failing address. Software may deduce the failing address from the current block status indicators.

42.6.1 Known PXP Limitations/Issues

The PXP has the following known limitations:

1. When using the NEXT register, the interrupt enable setting should remain the same for all frames. If not, the PXP will change the interrupt enable register value and possible cause the loss of an interrupt.
2. Rotations of 180/270 are not supported when performing LCD handshakes

42.7 Dither Engine Block

There are 3 instances of the dither processing block (Dither0, Dither1 and Dither2) instantiated in the system and each has separate controls.

The dither engine takes in a buffer of 8 bit components at a time in block order from the previous module that is connected to its input. It is designed to process ~1 pixel/clock. It can process the pixels in a number of ways. It can write out the pixels unmodified (pass through), it can quantize the pixels from 8 bits to any smaller number of bits down to 1 bpp. The dithering algorithms supported is Ordered dithering.

A LUT (Look Up Table) transform can be configured to be done on the pixel either before or after dither dithering but not both. In addition there is a “final” independent register based LUT that can be applied at the end of the dither process just before the pixel is written out to the output buffer. The LUT values for this final LUT are programmed by software into register.

There are 3 instances of the dither processing block (Dither0, Dither1 and Dither2) instantiated in the system and each has separate controls.

42.7.1 Top Level Connections

The dithering engine is connected to the output of the rotation engine, but it can be bypassed by programming Mux 11. See the figure below:

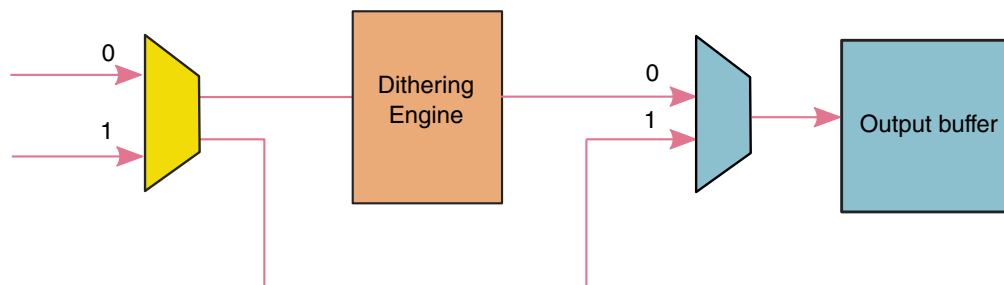

Figure 42-26. Dither Engine External Connections

The Dither Engine must be configured and enabled through the `HW_DITHER_CTRL` control register. The data flow is controlled through the valid, ready and pixel handshake signals with the Fetch and Store blocks. The Dither Engine must be enabled and given all required information such as LUT configuration, etc. After starting, the Fetch Engine will signal to the dither engine when it has data for processing.

The dimension information of the operation is not programmed in the Dither engine. It comes from the higher level pxp control register fields.

42.7.2 Dither Engine Design

The following diagram shows the detailed internal structure of the Dither Engine.

Figure 42-27. Detailed Block Diagram

1. Y8 configuration:- In this configuration only Dither0 is enabled. The Fetch Engine will fetch Y8 data and feed it to Dither0. Dither0 then writes resultant data, Y4 for instance, to the Store engine.
 2. RGB configuration:- In this mode all three dither engine instances are enabled. The Fetch Engine reads in RGB data from memory and gives 8 bits of the triplet to each dither engine. The resulting quantized or dithered data from each dither engine is passed to the same Store engine as in Y8 configuration and the Store Engine synchronizes, packs the data back together and writes it memory.
1. Pass Through:- In this mode the pixel data passes through unmodified
 2. Floyd-Steinberg Dithering:- This mode quantizes and dithers the pixels according to the standard Floyd-Steinberg algorithm that can be found in the literature. This algorithm employs an error dispersion technique that saves a fraction of the quantization error from each pixel and adds those partial errors to neighboring pixels. Therefore, the error memory buffers shown in the diagram are used in this mode to save the partial errors and retrieve them as they are needed when processing corresponding pixels in the next row below the current row.

3. **Atkinson Dithering:-** This mode employs the standard Atkinson dithering algorithm to quantize and dither the pixels. The standard algorithm in the literature is implemented. Atkinson is an error dispersion algorithm similar to Floyd-Steinberg except that the partial error coefficients are different and the error is dispersed two lines below the current row instead of one line below.
4. **Ordered Dithering:-** This is a standard algorithm that applies an index, or Bayer matrix to the pixels. Applying this matrix has the effect of changing the likelihood of a pixel being rounded up or down when being quantized. If this mode is specified, it requires use of the LUT memory so the `HW_PXP_DITHER_CTRL.LUT_MODE` field must be set to 0, or off. The `IDX_MATRIXx_SIZE` field specifies the dimensions of the index, or Bayer matrix. This is used to properly index into the LUT memory to retrieve the correct corresponding value to apply to the current pixel.
5. **Quantization only:-** This mode simply quantizes the pixel from 8 down to whatever bits per pixel are specified in the `NUM_QUANT_BIT` field. No dithering algorithm is used.

Before a detailed discussion of block functionality, it is important to note that there are 3 instances of the dither block within the PXP. All three, Dither0, Dither1 and Dither2 are connected to the same Fetch and Store engines. The system works in two configurations

1. **Y8 configuration:-** In this configuration only Dither0 is enabled. The Fetch Engine will fetch Y8 data and feed it to Dither0. Dither0 then writes resultant data, Y4 for instance, to the Store engine.
2. **RGB configuration:-** In this mode all three dither engine instances are enabled. The Fetch Engine reads in RGB data from memory and gives 8 bits of the triplet to each dither engine. The resulting quantized or dithered data from each dither engine is packed to 24 bit RGB and be written to memory by Store Engine.

The Dither Engine has the functionality to do a register based final LUT at the end of dither processing. This LUT is controlled by the `FINAL_LUT_ENABLE` bit. Notice that in the `HW_PXP_DITHER_CTRL` register there are separate `ENABLEx`, `DITHER_MODEx` and `IDX_MATRIXx_SIZE` controls for each engine. The `NUM_QUANT_BIT` and `LUT_MODE` control fields are common and apply to all dither engine instances.

To be included in a pxp processing flow operation, the `HW_PXP_CTRL_ENABLE_DITHER` bit must be set when the operation is executed. This is in addition to the `HW_PXP_DITHER_CTRL.ENABLEx` bits.

The process flow through the Dither Engine is detailed in the following sections.

Step1: Pre-Dither

The pixels are read into the pre-dither pipeline sub-block through the handshake with the Fetch Engine/ If there is error data or Ordered dither LUT matrix data that corresponds with the current pixel (this is mode dependent) then all these elements are fetched, synchronized and presented to the dither stage (green blocks in the above figure) simultaneously. The pre-dither, post_dither and Ordered dither matrix LUT pipeline module instances keep the data synchronized and flowing through the block. The pixel can go through a lookup table before the dither stage in the Pre-dither LUT pipeline or after in the Post-dither LUT pipeline. These blocks and the Ordered dither index pipeline block share the LUT memory through the LUT Memory Controller block. There is only one memory that is shared between these three functions and only one use can be selected for a given operation. In other words, the block can be configured to use pre-dither lookup, post-dither lookup or ordered dither mode but only one at a time. The pre or post lookup function is enabled through the HW_PXP_DITHER_CTRL.LUT_MODE field. Ordered dithering is enabled through the HW_PXP_DITHER_CTRL.DITHER_MODE_x field (Again, the memory can be used for only one purpose during any given operation). The LUT function uses an 8 bit address (the input data) to lookup 8 bits of data. The LUT memory must be pre-configured with the desired lookup table data.

Step2: Dither

After the pre-dither stage, the pixel and colateral data passes through the dither stage. There are 3 programmable modes in this stage that are specified with the HW_PXP_DITHER_CTRL.DITHER_MODE_x field.

1. Pass Through:- In this mode the pixel data passes through unmodified
2. Ordered Dithering:- This is a standard algorithm that applies an index, or bayer matrix to the pixels. Applying this matrix has the effect of changing the likelihood of a pixel being rounded up or down when being quantized. If this mode is specified, it requires use of the LUT memory so the HW_PXP_DITHER_CTRL.LUT_MODE field must be set to 0, or off. The IDX_MATRIX_x_SIZE field specifies the dimensions of the index, or bayer matrix. This is used to properly index into the LUT memory to retrieve the correct corresponding value to apply to the current pixel.
3. Quantization only:- This mode simply quantizes the pixel from 8 down to whatever bits per pixel are specified in the NUM_QUANT_BIT field. No dithering algorithm is used.

The output of this step is the quantized/dithered pixel packed into the most significant bits of an 8 bit byte. The unused bits in the lower part of the byte will be set to zero.

Step3: Post-Dither

The post-dither block is similar to its pre-dither counterpart. The processed pixel is queued up in preparation for write to the Store Engine. If `DITHER_MODEx` is not equal to Ordered mode, and a lookup operation is not selected in the pre-dither step, the `LUT_MODE` can be set to select a lookup operation in this step using the LUT memory.

Step4: Final Lookup

This combinatorial LUT step takes bits [7:4] of the output pixel and looks up an 8 bit value from the 16 value LUT to generate the final output pixel to the Store Engine. The LUT values are programmed into the LUT through the `HW_PXP_DITHER_FINAL_LUT_DATA0 - 3` registers. This operation is enabled through the `HW_PXP_DITHER_CTRL.FINAL_LUT_ENABLE` register field. This LUT is only available on the Dither0 instance.

42.7.3 Pipelined Data Flow

It is possible that the fetch engine could stall when there are valid pixels in various stages of the dither block. In this case the dither pipelines will not stall but will continue to drain and move data out to the store engine. Also, if the Store Engine stalls for a period of time and can not take any more data, flow control is implemented within the Dither block back to the Fetch Engine so that no pixel or error data is lost or becomes unsynchronized.

There are three `BUSY` bits in the `HW_PXP_DITHER_CTRL` register, one for each Dither Engine instance that software can poll to discover if the engine is busy or idle.

42.7.4 Initialization of Dedicated Memories

The internal memories for the Dither Engine instances, including 3 LUT memories can all be initialized through the register interface. This is done by configuring the `HW_PXP_MEM_CTRL` register and then writing the initialization data into the `HW_PXP_INIT_MEM_DATA` register. This simple interface is used as follows. Write the `HW_PXP_MEM_CTRL.SELECT` field with a value between 0-4 corresponding to the memory to be initialized. Write the `HW_PXP_MEM_CTRL.ADDR` field with the starting memory address to be written. Set the `HW_PXP_MEM_CTRL.START` field to begin the initialization operation. Note at all these fields can be set with a single write to the register. Then write the `HW_PXP_MEM_DATA` register with the data to be written to the location at `HW_PXP_MEM_CTRL.ADDR`. Each write to the data register increments and value of address so repeated writes to this register will put the data into sequential memory locations beginning with the offset in the `ADDR` field. The LUT memories are 8 bits wide. When 32 bit `DATA` writes occur with one of those memories

selected, the lower 8 bits are written. To fill these memories 256 writes to the HW_PXP_MEM_DATA register are required. Note that initialization for these memories are not necessary.

42.7.5 Register Configuration Interface

The HW_PXP_DITHER_CTRL register control fields to be set for each operation are included in the following table.

Signal or Group	Description
ENABLE	The hardware signal enables the dither block to function.
DITHER_MODE	Dither mode 0: passthrough, 3: Ordered, 4: no dithering quantization only, 5,6,7: Reserved. There is on field for each Dither Engine instance.
NUM_QUANT_BIT	How many bits to quantize to. Valid values are 7 down to 1.
LUT_MODE	Configures a LUT operation from local memory. The options are either pre-dither, post-dither or off. This setting affects all three Dither Engine instances.
IDX_MATRIXx_SIZE	These fields, one per instance, specifies the dimension (the matrix is square) of the Index Matrix used in Ordered dither mode.
FINAL_LUT_ENABLE	This field is only applicable to instance 0 of the three Dither Engines and enables/disables the final register based LUT of the output pixel just before outputting it to the Store Engine.

42.8 Waveform Engines

42.8.1 Overview

The WFE (Waveform Engine) is a very flexible, programable engine that can be used to implement various algorithms to transform the incoming data to the output. It is always used in connection with the Fetch Engine on the input side and a Store Engine on the output. These three sub-blocks work as a unit. There is an optional ALU block between the WFE and Store engines that can be used to make further modifications to the WFE output before storing the output. See the figure below.

Figure 42-28. Block Diagram

The WFE can process one pixel and associated data per clock.

The Fetch Engine fetches and formats the input pixel data streams according to the requirements and programming of the WFE. The WFE takes in the data from the Fetch Engine through a standard valid/ready signalling interface.

Inside the WFE the data passes through a 3 stage pipeline. Each stage consists of various programmable logic elements including muxes, lookup tables, comparitors, ALU's and registers. The output information calculated in the WFE is output to the Store Engine also using a standard valid/ready signalling interface.

The Store Engine reads the data from the WFE in the programmed format reformats the data according to working buffer pixel formats and stores the frame and associated data to memory.

42.8.2 Functionality

There is one WFE instance arranged in the PXP standard flow. It can be used as WFE-A or WFE-B.

In the standard usecase WFE-A is used for pixel collision detection and also to compute grayscale color transition information used later in the REGL/D algorithm.

In the standard usecase the WFE-B engine takes in pixel information and the results of WFE-A processing and implements the REAGL/D algorithm on the data. The output results in all the information necessary for the EPDC block to update the E-INK panel.

The definitions, functionality and programming of the logical elements within the WFE is NXP, Inc. proprietary information. The register programming necessary for any given function required will be supplied by NXP to the customer.

The WFE block can be independently held in reset by setting the HW_PXP_WFE_x_CTRL.SW_RESET bit to 1. This bit should only be set when the HW_PXP_WFE_x_CTRL.ENABLE bit is 0.

42.9 PXP Store Engine Block Description

42.9.1 Overview

The essential function of the Store Engine is to store input data from the input sub-block to memory or directly output to next sub-block. The input source is 32 bits per channel per valid clock. There is one instance of the Store Engine in the PXP. The main supported features are:

- Two DMA controllers thus it can work on two channel data storage at the output at the same time. If there is only one stream data input, store engine should use channel 0 but not channel1.
- Accepts as input up to 8 bytes data (two channels, 32 bits each) and 8 bits flag input. After shift operation it can store up to 64bpp per valid clock to memory.
- Data fill function for initialization. It can fill a fixed 32 bit data value to a specified memory buffer.
- Handshake mode with a downstream connected data Fetch Engine. It supports 1 line, 4 lines, 8 lines and 16 lines scan handshake with and 1 line, 3 lines and 5 lines array handshake modes. The Store Engine signals to the Fetch Engine when data is available for processing thus eliminating the need for software intervention through interrupt service routines.
- Bypass mode which directly outputs the data to the downstream connected Fetch Engine after shift operation. This is done through a valid/ready data interface.
- Support for 8x8 and 16x16 block mode and scanline mode.
- Support for 8, 16 and 32 bpp input data format.

42.9.2 Top-level architecture

The PXP consist of several pipelined blocks that perform the video source frame scaling, color space conversion, alpha-blending/color key algorithm, secondary CSC, pixel correction , input and/or output rotation, dithering and waveform processing.

The legacy blocks operate within the requirements of the legacy PXP architecture, and perform operations on either 8x8 or 16x16 pixel blocks in the representative source buffers. The legacy pipeline operate within the context of two iteration counters that iterate through the appropriate grid of input blocks to produce the rotated output grid blocks in scan-line order. The dither blocks included in the legacy pipeline also operate in a block mode while the waveform processing engines (WFE) will operate in a scan line format based on the active size.

Figure 42-1 shows the high-level architecture of the scaling, color space conversion, blending, pixel correction , rotation engines, dithering, waveform processing, along with histogram. The Alpha Surface Engine fetches one RGB graphics plane alpha surface (AS). The scaling engine fetches a single processed surface (PS), which can be blended with the AS surface. The scaling engine also supports an alpha channel for the PS image. Although the legacy PXP processes NxN pixel macro blocks, each of the AS or PS surfaces can have any pixel alignment within the output buffer. There are no restrictions and any pixel coordinates within the output buffer are valid. The upper left origin of the output buffer is defined as pixel 0,0. The upper left and lower right coordinates for each of the AS and PS are inclusive within the output buffer.

Figure 42-2 represents a sample output buffer configuration with both an AS and PS included. The alignment of each AS and PS within the output buffer can be at any arbitrary pixel locations. For example, the PS has an upper left coordinate (ULC) of 2,2 and a lower right coordinate (LRC) at pixel 13,13. The maximum value for the ULC and LRC for each of the AS and PS is bounded by the LRC of the output buffer, 15,15 for this example.

Figure 42-29. Sample output buffer configuration

The AS engine supports RGB pixel formats, and the PS engine supports ARGB, RGB, YUV, and YCbCr pixel formats. The CSC1 can be used to convert to RGB pixel formats so that the PS surface can be blended with the AS surfaces in the compositing engine in the RGB color space. There are two rotate engines in the PXP pipeline. Rotation can occur after image composition, at the output of the PS engine, or both. In the first scenario, all the data produced by the AS and PS engines is rotated. When the rotation module is programmed to rotate only PS images, the AS is not rotated, and AS pixels are combined with rotated PS surfaces. The CSC2 unit can convert to any RGB, YUV, or YCbCr color spaces for final output. Pixels can be corrected using a programmable LUT resource to achieve any desired pixels effects. For detailed information, please refer to [Output Modes to RGBW4444CFA](#). The dither engine supports ordered dithering mode in addition to the standard quantization and pass-through modes. The WFE is a programmable engine that can be programmed as required to process each pixel and pixel meta data. The Histogram sub-block collects statistics about the pixel data passing through it that is useful to the EPDC in waveform selection and displaying the frame. The Histogram also contains mask and comparison functionality that can be used for collision detection and reporting of the collided area within an update area.

The PXP also supports two parallel image processing paths. The legacy flow can operate in parallel with waveform processing engines. Please refer to HW_PXP_CTRL and HW_PXP_CTRL2 for details on how to enable each of the individual data flows. In addition to this, LUT engine can be used as either part of the legacy flow or as a part of the second parallel data flow. These blocks can work in the scan line format or in block format.

42.9.3 Store Engine Design

42.9.3.1 Input Data Source

1. Fixed Data Input

The Store Engine supports a fill function which writes a fixed value to a specific set of memory locations. The data received from the input is ignored. This function is usually used to initialize a memory buffer. The address of the buffer to fill is set in the HW_PXP_x_STORE_FILL_DATA_CH0 register. Also, this mode can only work through channel 0 and not channel 1.

In this mode HW_PXP_INPUT_STORE_CTRL_CH0.FILL_DATA_EN=1. The fixed value is set in FILL_DATA_CH0 register. How many bits are valid from HW_PXP_INPUT_STORE_FILL_DATA_CH0 register is decided by HW_PXP_x_STORE_SHIFT_CTRL_CH0.OUTPUT_ACTIVE_BPP.

2. Normal Data Input

Store Engine supports two 32 bits wide data channels and 8 bits flag input. If there is only one channel of data input, the channel 0 must be used not channel 1. In this case, HW_PXP_INPUT_STORE_CTRL_CH0.COMBINE_2CHANNEL=0.

If both channels and 8 bits flag input contain valid data, then the COMBINE_2CHANNEL bit should be set to 1. The Store Engine will then combine the two channels of data into 64 bits of data send them with the 8 bits of flags to the shift module. After shift, the Store Engine will choose the active bits from the 64 bit output according to HW_PXP_x_STORE_SHIFT_CTRL_CHx.OUTPUT_ACTIVE_BPP and then pack them in preparation for output.

42.9.3.2 Store data shift operation

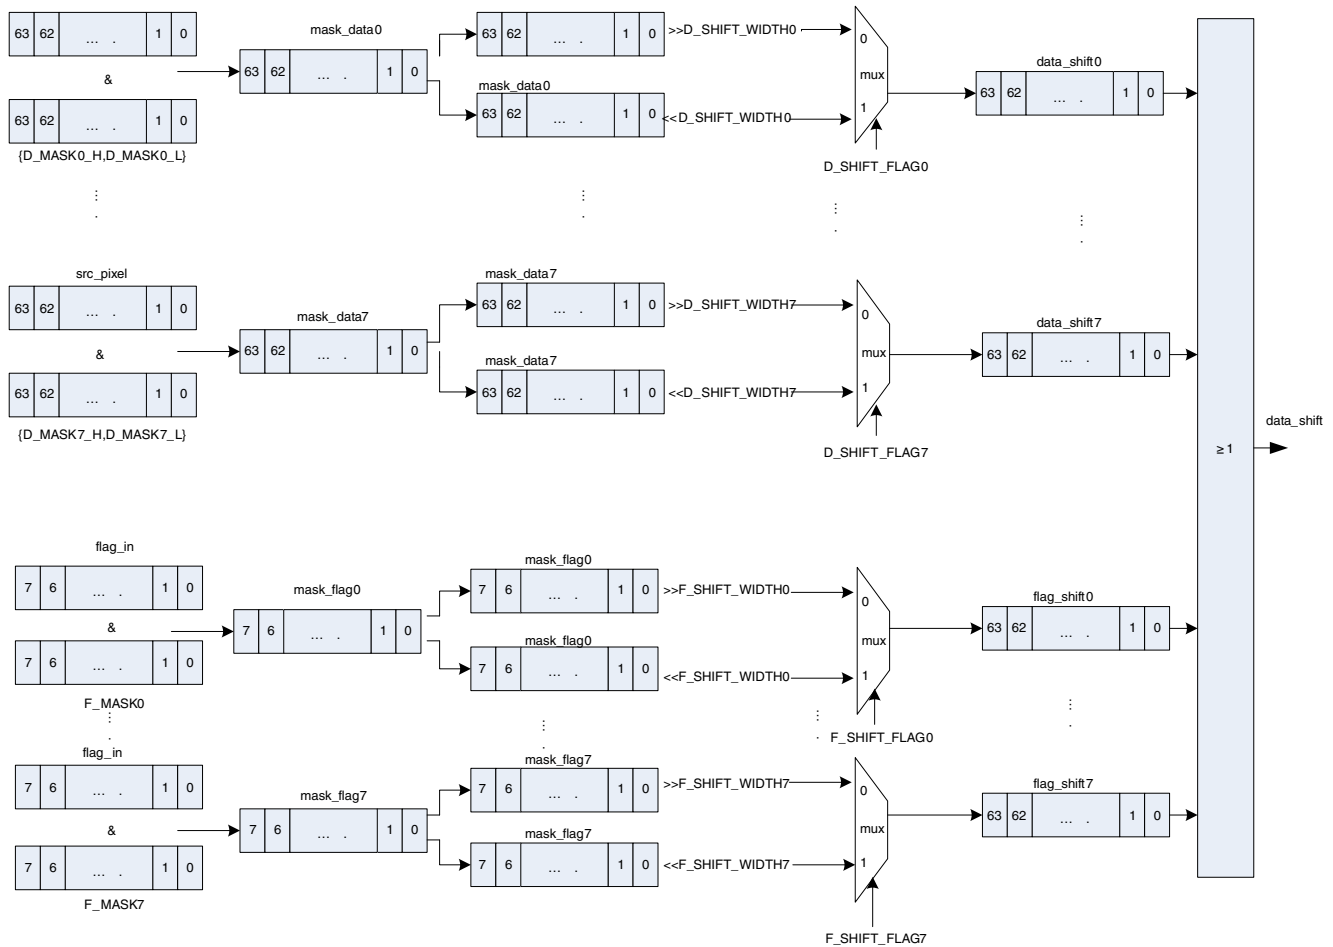

The data shift operation supports up to 8 data fields and 8 flag components to be shifted to any position within the 64 bit word. The data fields can be any width. This function is a way to reorder or reformat the component parts of the 64 bit word output. As data flows through the Store Engine each data word is processed the same way according to register configuration.

The following registers are used in shift operation. The pairs of {HW_PXP_x_STORE_D_MASKx_H_CHx, HW_PXP_x_STORE_D_MASKx_L_CHx} make up the 64 bits of mask for each MASKx component. There are a set of masks for each channel in each instance. The D_SHIFT_FLAG0 ~ D_SHIFT_FLAG7 fields in the HW_PXP_x_STORE_D/F_SHIFT_L/D_CHx registers specify which direction to shift (0: right shift 1: left shift) each data component0 ~ component7 after the mask is applied. The D_SHIFT_WIDTH0 through D_SHIFT_WIDTH7 fields specify how many bits to right or left shift each data component 0 through7 after the mask is applied.

The shift function works the same for the 8 bits of flag data. There are analogous “F_SHIFT” registers that contain the F_MASKx, F_SHIFT_FLAGx and F_SHIFT_WIDTHx register fields for swizzling the input flags.

The figure below shows how the shift function works.

PXP Store Engine Block Description

42.9.3.3 Data Packing

After data shift, the 64 bits of data can be divided to two 32bit words depending on the value of the `HW_PXP_x_STORE_CTRL_CHx.PACK_IN_SEL` bits. If `HW_PXP_x_STORE_CTRL_CH0.PACK_IN_SEL = 0`, it will select active bits from all 64 bits of data. If equal to 1, it will select active bits from the lower 32 bits data.

For channel 1, if `HW_PXP_x_STORE_CTRL_CH1.PACK_IN_SEL = 0`, it will also select active bits from all 64 bits data and if equal to 1, it will select active bits from the higher 32 bits data.

Store Engine supports 8bpp, 16bpp, 32bpp and 64bpp active bits per pixel according to `OUTPUT_ACTIVE_BPP` register setting. When either channel's `PACK_IN_SEL = 1` only 8bpp, 16bpp, 32bpp can be selected.

After shift and data output selection, the packing module will pack the data into a 64 bit string and store to a FIFO before writing out to memory.

Packing style according to active bpp is showed below.

OUTPUT_ACTIVE_BPP	Active bpp from 64 shift output data	Packed data
0	8 bits	{pix7, pix6, pix5, pix4, pix3, pix2, pix1, pix0}
1	16 bits	{pix3, pix2, pix1, pix0}
2	32 bits	{pix1, pix0}
3	64 bits	{pix0}

42.9.3.4 Data Store Format

- **Scanline mode**

When `HW_PXP_x_STORE_CTRL_CHx.BLOCK_EN=0`, the Store Engine will store data the line by line in scanline mode. The AXI burst length is set by the `HW_PXP_x_STORE_CTRL_CHx.WR_NUM_BYTES` register field. In Scanline mode, it can support 8, 16, 32 and 64 bytes in a burst.

- **Block mode**

When `HW_PXP_x_STORE_CTRL_CHx.BLOCK_EN=1`, the Store Engine support 8x8 and 16x16 block mode according to `HW_PXP_x_STORE_CTRL_CHx.BLOCK_16` register bit. When `BLOCK_16=1`, the block size is 16*16 while if `BLOCK_16=0` the size is 8*8 blocks. When `BLOCK_EN=1`, then `HW_PXP_x_STORE_SHIFT_CTRL_CHx.OUTPUT_ACTIVE_BPP` cannot be 3, that is, block mode can not work on a 64bpp data stream.

When the Store Engine is configured block mode, the upstream Fetch Engine should be configured in block mode and with the same block size as well.

When the total width or total height of image is no divisible by 8 or 16, the upstream Fetch Engine will fetch extra pixels or lines to fill out the final partial blocks. For example, if the size is 23*23, and block mode is 8*8, Fetch Engine will fetch 24*24 data pixels and output to store engine. The Store Engine has a crop function for this. That is, the extra pixels or lines will not be stored to memory by the Store Engine. This is accomplished by the hardware using the AXI bus byte enables.

In block mode, the number of AXI bus write bytes is internally calculated from the `OUTPUT_ACTIVE_BPP` and `BLOCK_16` (block size) register fields rather than the `WR_NUM_BYTES` field.

One limitation exists with block mode configuration. No YUV422 output format is not supported. So HW_PXP_x_STORE_SHIFT_CTRL_CHx.OUT_YUV422_1P_EN and OUT_YUV422_2P_EN must be disabled.

42.9.3.5 Output Format Modes

- **Normal mode**

If HW_PXP_x_STORE_CTRL_CHx.STORE_BYPASS_EN = 0, HW_PXP_x_STORE_CTRL_CHx.STORE_MEMORY_EN=1 and HW_PXP_x_STORE_CTRL_CHx.HANDSHAKE_EN=0, the Store Engine is working in normal mode.

In normal mode, the Store Engine will store the input data to memory frame by frame. The store frame start address is set in HW_PXP_x_STORE_ADDR_x_CHx. Two address registers exist for each channel. The second one is used for YUV422 2 plane mode.

The Store Engine will stop storing data when the frame of data is finished. Another pxp_start signal will trigger the next frame operation. The frame size is specified by the HW_PXP_x_STORE_SIZE_CHx registers. The values should be set up for each channel in use. If both channels are being used, the height and width values in the HW_PXP_x_STORE_SIZE_CH0 and HW_PXP_x_STORE_SIZE_CH1 registers may be different but the total number of pixels in the frame must be the same. The only exception to this is when both channels are being used and the Store Engine is outputting data in handshake mode. In handshake mode the width and height must be set the same in both channel size registers.

If the data shift mode is set to YUV422 single plane or 2 plane, two pixels, 64 bits, are read in and 32 bits are written. If the YUV data is coming from the upstream Fetch Engine it will be in YUV444 format as {8'h0, Y0, U0, V0, 8'h0, Y1, U1, V1}. Even though the YUV422 mode is set, the shift function must be set to shift the components into their proper position. For instance, for 1p mode, the shift MASK, FLAG and WIDTH parameters need to be set up on the 64 bits of pixel data to format each 32 bits (2 pixels) to be written out as {Y0, U0, Y1, V0}. Likewise in 2p mode, the ch0 data would be shifted to yield {Y0, Y1} with ch1 as {U0, V0} for the first two pixels.

- **Bypass mode**

If STORE_BYPASS_EN=1, STORE_MEMORY_EN=0, The Store Engine will output the input data, after the shift function, directly to the downstream Fetch Engine instead of storing to memory. The AXI bus is inactive in this case. The data is output using the valid/ready external interface to the downstream connected Fetch Engine.

In bypass mode, if HW_PXP_x_STORE_CTRL_CH0.CH_EN=1, it will output the lower 32 bits of data. If HW_PXP_x_STORE_CTRL_CH1.CH_EN=1, it will output the high 32 bits of data.

- **Dual mode**

If STORE_BYPASS_EN = 1 and HW_PXP_x_STORE_CTRL_CHx.STORE_MEMORY_EN = 1, the Store Engine is configured in Dual mode. That is, the Store Engine supports bypassing the data and also storing it to memory at the same time.

- **Handshake mode**

The Store Engine supports a 1 line, 4 line, 8 line and 16 lines scan handshake configuration and 1 line, 3 lines and 5 lines array handshake configurations with next Fetch Engine.

The array handshake is used in cases where the Fetch Engine is in array mode. One line handshake config indicates that the Fetch Engine is working on 1x1 array mode. The 3 line handshake indicates the Fetch Engine work is in 3x3 array while 5 line handshake indicates 5x5 array mode.

To accomplish the buffer sharing, Store Engine and the attached Fetch Engine will maintain buffer status using a pair of handshake signals. When a buffer is filled by the Store Engine, it will assert the handshake_bx_ready (where x is 0 or 1) signal to indicate to the fetch engine that the buffer has valid data. The prefetch engine will then release the buffer by asserting the handshake_bx_done signal.

The basic protocol and timing is shown in the diagram below:

Unlike scanline handshake, there is only 1 buffer in memory. The buffer size is $(array_line + 1)$.

- 1 line array handshake

When `HW_PXP_x_STORE_CTRL_CHx.ARRAY_LINE_NUM = 0`, the configuration is 1 line handshake mode. The buffer size is $2 * OUT_PITCH$ (2 lines). The first ready occurs when the Store Engine finishes writing 1 line.

- 3 line array handshake

When `ARRAY_LINE_NUM = 1`, the configuration is 3 line handshake mode. The buffer size is $4 * OUT_PITCH$. The first ready occurs when the Store Engine finishes writing 2 lines.

- 5 line array handshake

When `ARRAY_LINE_NUM=2`, the configuration is 5 line handshake mode. The buffer size is $6 * OUT_PITCH$. The first ready occurs when store engine finishes writing 3 lines.

For scanline handshake with next fetch engine, it is similar to LCDIF Handshake section without abort special process.

42.9.3.6 Limitations

When both channels are active, they should be configured to work in the same mode. For example, if channel 0 is configured for bypass mode then channel 1 must also be configured the same way.

42.10 Histogram

The histogram block collects statistics about the pixel -5data passing through it. Its primary function is to compare the value against programmed values representing the allowed values in different bpp (bits per pixel) modes or bins. A flag value of 1 is recorded if all the pixel values were a match for one of the values programmed for that bit per pixel mode or bin. If there is a mismatch for at least one pixel then the update is not completely contained within that bin and the output flag is 0. There are 5 bits reported. One for each of 1-5 bpp. The results for each bpp bin are always reported. These results are a necessary input to the EPDC for selecting the proper waveform for update to the panel. The pixel value and the compare values are always 6 bits wide although the max effective bpp is 5.

There is also a mask function that can be used to filter out update pixels and exclude them from histogram calculations. It's primary use-case is to collect and report collisions of the current update being processed through the WFE-A and report to software how many pixels collided with current live updates, if any, and the coordinates of the minimum rectangle within the update that contains all collided pixels.

There are two identical instances of the histogram block in the system. They both can be programmed through a system mux to take data from the outbuf sub-block from the legacy flow and WFE.

42.10.1 Basic Operation

The basic controls for each histogram engine are contained within their HW_PXP_HIST_x_CTRL and HW_PXP_HIST_x_MASK registers. We will use histogram A registers for explanation purposes in the description below.

The HW_PXP_HIST_A_CTRL.ENABLE bit turns on the histogram block to process pixels. It must be turned on and off manually. The HW_PXP_HIST_A_CTRL.CLEAR bit must be set to clear the histogram results. The bit is self-clearing. The input data (pixel) to the block is 72 bits wide. The comparison is done on 6 bits of pixel data. Any contiguous 6 bits in the 72 bit string can be chosen for comparison using the HW_PXP_HIST_A_CTRL.PIXEL_OFFSET and HW_PXP_HIST_A_CTRL.PIXEL_WIDTH fields. The offset specifies the starting bit position in the string and the width field specifies the width which should not be wider than 6 bits in the current implementation. The mode values for comparison are contained

in the HW_PXP_HISTx_PARAMx register fields. Even though these fields are 6 bits wide, 5 bits is the effective width as the histogram can check for 32 unique pixel values in the largest mode, HIST32.

The result of which bpp modes were a match for all pixels since the output was cleared are continuously updated in the HW_PXP_HIST_A_CTRL.STATUS field. There is one bit for each bpp mode. All histogram bpp modes are checked simultaneously. The HW_PXP_HIST_A_BUF_SIZE fields specify the height and width of the update area. This allows the histogram engine to keep track of the relative coordinates of each new pixel it receives. It assumes the pixels are fed to it in raster order, left to right and top to bottom.

42.10.2 Mask Functionality

There is also a mask function within the histogram engine that tests a specified string of bits from the input against values programmed into the mask register. The use-case for this is to report collision detection back to controlling software. If the mask test passes then the pixel is active and is processed in the engine and statistics collected. If the pixel is not active then it is discarded and not processed – does not contribute to the output results. Based on the outcome of this mask test, there are some additional results that are output to register fields. They are the number of active pixels, the coordinates of the smallest bounding box including all active pixels and an array of 64 bits where the offset of each bit corresponds to the pixel value of processed pixel. The bit is set for each valid pixel value processed.

The configuration of the mask function is contained in the HW_PXP_HIST_x_MASK register. The HW_PXP_HIST_A_MASK.MASK_EN bit turns on the function. . The HW_PXP_HIST_A_CTRL.CLEAR bit clears the results. The HW_PXP_HIST_A_MASK.MASK_MODE field specifies the logical operation for the test. The options are “equal”, “not equal”, “inside” or “outside.” The HW_PXP_HIST_A_MASK.MASK_VALUE0 and HW_PXP_HIST_A_MASK.MASK_VALUE1 are used for comparison with the incoming value depending on the mode chosen. The starting bit of mask field in the 72 bit input data is specified by the HW_PXP_HIST_A_MASK.MASK_OFFSET register field and the width is given by HW_PXP_HIST_A_MASK.MASK_WIDTH. The width of the mask is a maximum of 8 bits. If the mask mode test passes for a given input then the HW_PXP_HIST_A_TOTAL_PIXEL read only value is incremented. The x and y coordinates of the pixel are used to calculate the minimum rectangle the will enclose all valid pixels. This information can be read from the HW_PXP_HIST_A_ACTIVE_AREA_X and HW_PXP_HIST_A_ACTIVE_AREA_Y registers. Also, the values of the valid pixels are recorded in the

HW_PXP_HIST_A_RAW_STAT0 and HW_PXP_HIST_A_RAW_STAT0 registers. These registers make up 64 one bit fields where the offsets of the bit that are set are the pixel values of the active pixels. (The values as specified by the HW_PXP_HIST_A_CTRL.PIXEL_OFFSET and HW_PXP_HIST_A_CTRL.PIXEL_WIDTH fields.)

42.10.3 Collision use-case Example

In this example, the histogram engine is used to test for and report collision information within the update. Refer to the figure below. With normal WFE-A processing, within the 72 bit output there will be a one bit collision flag that is assert to 1 if there was a collision on that update pixel. There will also be a 6 bit field that specifies the EPDC LUT number for that pixel in the working buffer. If there was a collision this LUT number identifies the unique colliding live update. To convey all this information to software using the histogram engine, the HW_PXP_HIST_A_CTRL.PIXEL_OFFSET and HW_PXP_HIST_A_CTRL.PIXEL_WIDTH should be set to point to the current LUT in the input bus. The HW_PXP_HIST_A_MASK.MASK_OFFSET and HW_PXP_HIST_A_MASK.MASK_WIDTH fields should be set to point to the collision bit. The HW_PXP_HIST_A_MASK.MASK_MODE should be 0 or “equal” and the HW_PXP_HIST_A_MASK.MASK_VALUE0 should be set to 1.

The figure above shows the processed results of our example. There is an update region, 499x449, offset within the 800x600 panel display. After enabling the histogram and processing the update, there is a collided region within the update region and 4 collided pixels were detected. The results are as follows.

The HW_PXP_HIST_A_TOTAL_PIXEL register would equal to 4 showing that 4 pixels were found by the mask function to have their collision bits set.

The relative collision area are would be given in the HW_PXP_HIST_A_ACTIVE_AREA_X and Y register as MIN_X_OFFSET = 50, MAX_X_OFFSET = 300, MIN_Y_OFFSET = 50, MAX_Y_OFFSET = 380.

If pixel A is being updated by LUT 1, pixel B and C are being updated LUT 5, and pixel D is being updated by LUT 12, then the LUT Collision Status = 0x00001022 (bit 1, 2, 12 are set). That is HW_PXP_HIST_A_RAW_STAT0 would be equal to 0x00001022 and HW_PXP_HIST_A_RAW_STAT1 would be 0x00000000.

42.11 PXP Memory Map/Register Definition

PXP Hardware Register Format Summary

PXP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

42.11.1 Control Register 0 (PXP_HW_PXP_CTRL)

The CTRL register contains controls for the PXP module.

HW_PXP_CTRL: 0x000

HW_PXP_CTRL_SET: 0x004

HW_PXP_CTRL_CLR: 0x008

HW_PXP_CTRL_TOG: 0x00C

The Control register contains the primary controls for the PXP block.

EXAMPLE

```
REG_CTRL_SET(BM_PXP_CTRL_SFTRST);
REG_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

PXP_HW_PXP_CTRL field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal PXP operation. Set this bit to one (default) to disable clocking with the PXP and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the PXP block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.

Table continues on the next page...

PXP_HW_PXP_CTRL field descriptions (continued)

Field	Description
29 RSVD4	Reserved, always set to zero.
28 Reserved	This read-only field is reserved and always has the value 0.
27 ENABLE_ ROTATE1	Enable the ROTATE1 engine in the PXP primary processing flow.
26 ENABLE_ ROTATE0	Enable the ROTATE0 engine in the PXP primary processing flow.
25 ENABLE_LUT	Enable the LUT engine in the PXP primary processing flow.
24 ENABLE_CSC2	Enable the CSC2 engine in the PXP primary processing flow.
23 BLOCK_SIZE	Select the block size to process through the Rotate block. 0x0 8X8 — Process 8x8 pixel blocks. 0x1 16X16 — Process 16x16 pixel blocks.
22 RSVD1	Reserved, always set to zero.
21 ENABLE_ ALPHA_B	Enable the Alpha-B engine in the PXP primary processing flow.
20 ENABLE_ INPUT_FETCH_ STORE	Enable the Input Fetch and Store engine in the PXP primary processing flow.
19 ENABLE_WFE_B	Enable the WFE-B engine in the PXP primary processing flow.
18 ENABLE_WFE_A	Enable the WFE-A engine in the PXP primary processing flow.
17 ENABLE_ DITHER	Enable the Dithering engine in the PXP primary processing flow.
16 ENABLE_PS_ AS_OUT	Enable the PS engine, AS engine, OUTBUF in the PXP primary processing flow.
15 VFLIP1	Indicates that the input should be flipped vertically (effect applied before rotation).
14 HFLIP1	Indicates that the input should be flipped horizontally (effect applied before rotation).
13–12 ROTATE1	Indicates the clockwise rotation to be applied at the input buffer. The rotation effect is defined as occurring after the FLIP_X and FLIP_Y permutation. 0x0 ROT_0 — 0x1 ROT_90 — 0x2 ROT_180 — 0x3 ROT_270 —

Table continues on the next page...

PXP_HW_PXP_CTRL field descriptions (continued)

Field	Description
11 VFLIPO	Indicates that the output buffer should be flipped vertically (effect applied before rotation).
10 HFLIPO	Indicates that the output buffer should be flipped horizontally (effect applied before rotation).
9–8 ROTATE0	Indicates the clockwise rotation to be applied at the output buffer. The rotation effect is defined as occurring after the FLIP_X and FLIP_Y permutation. 0x0 ROT_0 — 0x1 ROT_90 — 0x2 ROT_180 — 0x3 ROT_270 —
7–6 RSVD0	Reserved, always set to zero.
5 HANDSHAKE_ ABORT_SKIP	When skip is enable, even the abort asserted, pxp will not assert the ready directly but wait for whole block line complete.
4 ENABLE_LCD0_ HANDSHAKE	Enable handshake with LCD0 controller. When this is set, the PXP will not process an entire framebuffer, but will instead process rows of NxN blocks in a double-buffer handshake with the LCDIF. This enables the use of the onboard SRAM for a partial frame buffer.
3 LUT_DMA_IRQ_ ENABLE	LUT DMA interrupt enable. When set, the PXP will issue an interrupt when the LUT DMA has finished transferring data.
2 NEXT_IRQ_ ENABLE	Next command interrupt enable. When set, the PXP will issue an interrupt when a queued command initiated by a write to the PXP_NEXT register has been loaded into the PXP's registers. This interrupt also indicates that a new command may now be queued.
1 IRQ_ENABLE	Interrupt enable. NOTE: When using the HW_PXP_NEXT functionality to reprogram the PXP, the new value of this bit will be used and may therefore enable or disable an interrupt unintentionally.
0 ENABLE	Enables PXP operation with specified parameters. The ENABLE bit will remain set while the PXP is active and will be cleared once the current operation completes. Software should use the IRQ bit in the HW_PXP_STAT when polling for PXP completion.

42.11.2 Status Register (PXP_HW_PXP_STAT)

The PXP Interrupt Status register provides interrupt status information.

HW_PXP_STAT: 0x010

HW_PXP_STAT_SET: 0x014

HW_PXP_STAT_CLR: 0x018

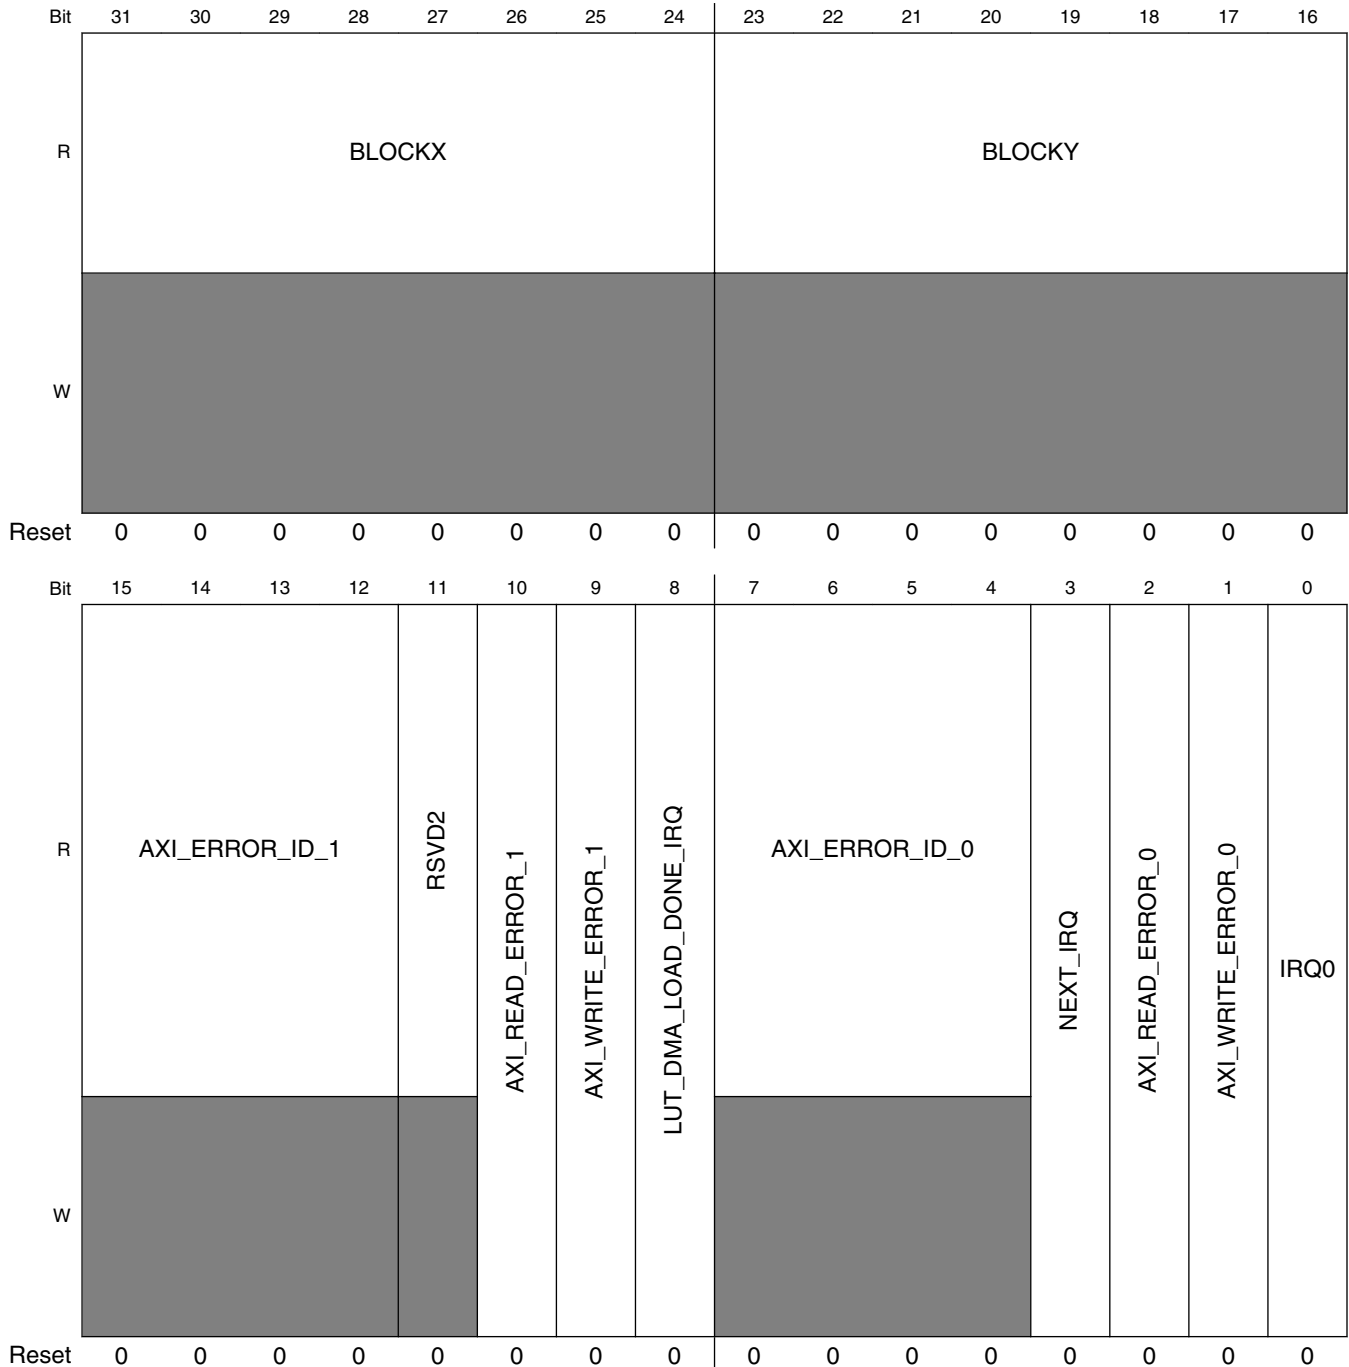

HW_PXP_STAT_TOG: 0x01C

This register provides PXP interrupt status and the current X/Y block coordinate that is being processed.

EXAMPLE

```
REG_STAT_CLR(BM_PXP_STAT_IRQ); // clear CSC interrupt
```

Address: 21C_C000h base + 10h offset = 21C_C010h

PXP_HW_PXP_STAT field descriptions

Field	Description
31–24 BLOCKX	Indicates the X coordinate of the block currently being rendered.

Table continues on the next page...

PXP_HW_PXP_STAT field descriptions (continued)

Field	Description
23–16 BLOCKY	Indicates the X coordinate of the block currently being rendered.
15–12 AXI_ERROR_ID_1	Indicates the AXI1 ID of the failing bus operation.
11 RSVD2	Reserved, always set to zero.
10 AXI_READ_ERROR_1	Indicates PXP encountered an AXI read error and processing has been terminated.
9 AXI_WRITE_ERROR_1	Indicates PXP encountered an AXI write error and processing has been terminated.
8 LUT_DMA_LOAD_DONE_IRQ	Indicates that the LUT DMA transfer has completed.
7–4 AXI_ERROR_ID_0	Indicates the AXI0 ID of the failing bus operation.
3 NEXT_IRQ	Indicates that a command issued with the "Next Command" functionality has been issued and that a new command may be initiated with a write to the PXP_NEXT register.
2 AXI_READ_ERROR_0	Indicates PXP encountered an AXI read error and processing has been terminated.
1 AXI_WRITE_ERROR_0	Indicates PXP encountered an AXI write error and processing has been terminated.
0 IRQ0	Indicates current PXP interrupt status. The IRQ is routed through the <code>pxp_irq</code> when the <code>IRQ_ENABLE</code> bit in the control register is set.

42.11.3 Output Buffer Control Register (PXP_HW_PXP_OUT_CTRL)

The `OUT_CTRL` register contains controls for the Output Buffer.

`HW_PXP_OUT_CTRL`: 0x020

`HW_PXP_OUT_CTRL_SET`: 0x024

`HW_PXP_OUT_CTRL_CLR`: 0x028

`HW_PXP_OUT_CTRL_TOG`: 0x02C

Control register to determine OUT buffer processing.

EXAMPLE

```
REG_CTRL_SET(BM_PXP_CTRL_SFTRST);
REG_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 21C_C000h base + 20h offset = 21C_C020h

PXP_HW_PXP_OUT_CTRL field descriptions

Field	Description
31–24 ALPHA	When generating an output buffer with an alpha component, the value in this field will be used when enabled to override the alpha passed through the pixel data pipeline.
23 ALPHA_OUTPUT	Indicates that alpha component in output buffer pixels should be overwritten by REG_OUT_CTRL[ALPHA] register. If 0, retain their alpha value from the computed alpha for that pixel.
22–10 RSVD1	Reserved, always set to zero.
9–8 INTERLACED_OUTPUT	Determines how the PXP writes it's output data. Output interlacing should not be used in conjunction with input interlacing. Splitting frames into fields is most efficient using output interlacing. 2-plane output formats AND interlaced output is NOT supported.

Table continues on the next page...

PXP_HW_PXP_OUT_CTRL field descriptions (continued)

Field	Description
	0x0 PROGRESSIVE — All data written in progressive format to the OUTBUF Pointer. 0x1 FIELD0 — Interlaced output: only data for field 0 is written to the OUTBUF Pointer. 0x2 FIELD1 — Interlaced output: only data for field 1 is written to the OUTBUF2 Pointer. 0x3 INTERLACED — Interlaced output: data for field 0 is written to OUTBUF and data for field 1 is written to OUTBUF2.
7–5 RSVD0	Reserved, always set to zero.
FORMAT	Output framebuffer format. The UV byte lanes are synonymous with CbCr byte lanes for YUV output pixel formats. For example, the YUV2P420 format should be selected when the output is YCbCr 2-plane 420 output format. 0x0 ARGB8888 — 32-bit pixels 0x4 RGB888 — 32-bit pixels (unpacked 24-bit pixel in 32 bit DWORD.) 0x5 RGB888P — 24-bit pixels (packed 24-bit format) 0x8 ARGB1555 — 16-bit pixels 0x9 ARGB4444 — 16-bit pixels 0xC RGB555 — 16-bit pixels 0xD RGB444 — 16-bit pixels 0xE RGB565 — 16-bit pixels 0x10 YUV1P444 — 32-bit pixels (1-plane XYUV unpacked) 0x12 UYVY1P422 — 16-bit pixels (1-plane U0,Y0,V0,Y1 interleaved bytes) 0x13 VYUY1P422 — 16-bit pixels (1-plane V0,Y0,U0,Y1 interleaved bytes) 0x14 Y8 — 8-bit monochrome pixels (1-plane Y luma output) 0x15 Y4 — 4-bit monochrome pixels (1-plane Y luma, 4 bit truncation) 0x18 YUV2P422 — 16-bit pixels (2-plane UV interleaved bytes) 0x19 YUV2P420 — 16-bit pixels (2-plane UV) 0x1A YVU2P422 — 16-bit pixels (2-plane VU interleaved bytes) 0x1B YVU2P420 — 16-bit pixels (2-plane VU)

42.11.4 Output Frame Buffer Pointer (PXP_HW_PXP_OUT_BUF)

Output Framebuffer Pointer. This register points to the beginning of the output frame buffer. This pointer is used for progressive format and field 0 when generating interlaced output.

This register is used by the logic to point to the current output location for the output frame buffer.

EXAMPLE

```
REG_OUT_BUF_WR( buffer );
```

Address: 21C_C000h base + 30h offset = 21C_C030h

PXP_HW_PXP_OUT_BUF field descriptions

Field	Description
ADDR	Current address pointer for the output frame buffer. The address can have any byte alignment. 64B alignment is recommended for optimal performance.

42.11.5 Output Frame Buffer Pointer #2 (PXP_HW_PXP_OUT_BUF2)

Output Framebuffer Pointer #2. This register points to the beginning of the output frame buffer for either field 1 when generating interlaced output or for the UV buffer when in YUV 2-plane output modes. Both interlaced output AND 2-plane output modes are not supported in a single PXP operation. This register is NOT used as the pointer to the 2nd buffer when in LCDIF_HANDSHAKE mode.

This register is used by the logic to point to the current output location for the field 1 or UV output frame buffer.

EXAMPLE

```
REG_OUT_BUF_WR( field0 ); // buffer for interlaced field 0
REG_OUT_BUF2_WR( field1 ); // buffer for interlaced field 1
```

Address: 21C_C000h base + 40h offset = 21C_C040h

PXP_HW_PXP_OUT_BUF2 field descriptions

Field	Description
ADDR	Current address pointer for the output frame buffer. The address can have any byte alignment. 64B alignment is recommended for optimal performance.

42.11.6 Output Buffer Pitch (PXP_HW_PXP_OUT_PITCH)

This register contains the output buffer pitch in bytes.

Any byte value will indicate the vertical pitch. This value will be used in output pixel address calculations.

EXAMPLE

```
REG_OUT_PITCH_WR( 68 * 4 ); // The output buffer pitch is 68 pixels times 32 bits per pixel
```

Address: 21C_C000h base + 50h offset = 21C_C050h

PXP_HW_PXP_OUT_PITCH field descriptions

Field	Description
31-16 RSVD	Reserved, always set to zero.
PITCH	Indicates the number of bytes in memory between two vertically adjacent pixels.

42.11.7 Output Surface Lower Right Coordinate (PXP_HW_PXP_OUT_LRC)

This register contains the size, or lower right coordinate, of the output buffer NOT rotated. It is implied that the upper left coordinate of the output surface is always [0,0]. When rotating the framebuffer, the PXP will automatically swap the X/Y, or WIDTH/HEIGHT, to accommodate the rotated size.

This register sets the size of the output frame buffer in pixels, not blocks. The frame buffer need not be a multiple of NxN pixels. Partial blocks will be written for output frame buffer sizes that are not divisible by N pixels in either dimension.

EXAMPLE

```
REG_OUT_LRC[X]=319; // set width of output frame buffer to 320 pixels
REG_OUT_LRC[Y]=243; // set height of output frame buffer to 244 pixels which is not
divisible by block size N

REG_OUT_LRC_WR( BF_PXP_OUT_LRC_X(319) | BF_PXP_OUT_LRC_Y(243) );
```

Address: 21C_C000h base + 60h offset = 21C_C060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD1															
W			X													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0															
W			Y													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_OUT_LRC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	Indicates number of horizontal PIXELS in the output surface (non-rotated). The output buffer pixel width minus 1 should be programmed. The image size is not required to be a multiple of 8 pixels. The PXP will clip the pixel output at this boundary.
15–14 RSVD0	Reserved, always set to zero.
Y	Indicates the number of vertical PIXELS in the output surface (non-rotated). The output buffer pixel height minus 1 should be programmed. The image size is not required to be a multiple of 8 pixels. The PXP will clip the pixel output at this boundary.

42.11.8 Processed Surface Upper Left Coordinate (PXP_HW_PXP_OUT_PS_ULC)

This register contains the upper left pixel coordinate for the Processed Surface in the OUTPUT buffer.

This register contains the upper left coordinate of the Processed Surface in the output frame buffer (in pixels). Values that are within the REG_OUT_LRC[X,Y] extents are valid. The lowest valid value for these fields is 0,0. If the value of the REG_OUT_PS_ULC is greater than the REG_OUT_LRC, then no PS pixels will be fetched from memory, but only REG_PS_BACKGROUND pixels will be processed by the PS engine. Pixel locations that are greater than or equal to the PS upper left coordinates, less than or equal to the PS lower right coordinates, and within the REG_OUT_LRC extents will use the PS to render pixels into the output buffer.

EXAMPLE

```
REG_OUT_PS_ULC_WR(0,0x0002_0002); // Processed Surface upper left coordinate at (X,Y) = 2,2. The PS surface will not effect pixels in the first and second row and column of the output buffer.
```

PXP Memory Map/Register Definition

Address: 21C_C000h base + 70h offset = 21C_C070h

PXP_HW_PXP_OUT_PS_ULC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the upper left X-coordinate (in pixels) of the processed surface (PS) in the output buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the upper left Y-coordinate (in pixels) of the processed surface in the output buffer.

42.11.9 Processed Surface Lower Right Coordinate (PXP_HW_PXP_OUT_PS_LRC)

This register contains the lower right extent for the Processed Surface in the OUTPUT buffer.

This register contains the lower right coordinate of the Processed Surface in the output frame buffer (in pixels). Values that are within the REG_OUT_LRC[X,Y] extents are valid. The lowest valid value for these fields is 0,0. Pixel locations that are greater than or equal to the PS upper left coordinates, less than or equal to the PS lower right coordinates, and within the REG_OUT_LRC extents will use the PS to render pixels into the output buffer.

EXAMPLE

```
REG_OUT_PS_ULC_WR(0,0x03FF_03FF); // With this UL/LR pair of pixel coordinates, only one
pixel at OUT[X,Y]=1023,1023 will use the PS to contribute to its value.
REG_OUT_PS_LRC_WR(0,0x03FF_03FF);
```

Address: 21C_C000h base + 80h offset = 21C_C080h

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the lower right X-coordinate (in pixels) of the processed surface (PS) in the output frame buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the lower right Y-coordinate (in pixels) of the processed surface in the output frame buffer.

42.11.10 Alpha Surface Upper Left Coordinate (PXP_HW_PXP_OUT_AS_ULC)

This register contains the upper left location for the Alpha Surface in the output buffer.

This register contains the upper left coordinate of AS in the output frame buffer (in pixels). Values that are within the REG_OUT_LRC[X,Y] extents are valid. The lowest valid value for these fields is 0,0. Pixel locations that are greater than or equal to the upper left coordinates will use the AS to render pixels in the output buffer.

EXAMPLE

```
REG_OUT_AS_ULC_WR(0,0x0001_0001); // Alpha Surface upper left coordinate at (X,Y) = 1,1.
The AS surface will not effect pixels in the first row or first column of the output buffer.
```

Address: 21C_C000h base + 90h offset = 21C_C090h

29–16 X	This field indicates the upper left X-coordinate (in pixels) of the alpha surface (AS) in the output frame buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the upper left Y-coordinate (in pixels) of the alpha surface in the output frame buffer.

42.11.11 Alpha Surface Lower Right Coordinate (PXP_HW_PXP_OUT_AS_LRC)

This register contains the lower right extent for Alpha Surface in the output buffer.

This register contains the lower right coordinate of AS in the output frame buffer (in pixels). Values that are within the REG_OUT_LRC[X,Y] extents are valid. The lowest valid value for these fields is 0,0. Pixel locations that are less than or equal to the lower right coordinates will use the AS to render pixels in the output buffer.

EXAMPLE

```
REG_AS_LRC_WR(0,0x03FF_03FF); // Alpha Surface lower right coordinate at (X,Y) = 1023,1023.
```

Address: 21C_C000h base + A0h offset = 21C_C0A0h

PXP_HW_PXP_OUT_AS_LRC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the lower right X-coordinate (in pixels) of the alpha surface (AS) in the output frame buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the lower right Y-coordinate (in pixels) of the alpha surface in the output frame buffer.

42.11.12 Processed Surface (PS) Control Register (PXP_HW_PXP_PS_CTRL)

The PS_CTRL register contains controls for the Processed Surface Buffer.

HW_PXP_PS_CTRL: 0x0B0

HW_PXP_PS_CTRL_SET: 0x0b4

HW_PXP_PS_CTRL_CLR: 0x0B8

HW_PXP_PS_CTRL_TOG: 0x0BC

Control register to determine PS buffer processing.

EXAMPLE

```
REG_CTRL_SET(BM_PXP_CTRL_SFTRST);
REG_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 21C_C000h base + B0h offset = 21C_C0B0h

PXP Memory Map/Register Definition

PXP_HW_PXP_PS_CTRL field descriptions

Field	Description
31–12 RSVD1	Reserved, always set to zero.
11–10 DECX	Horizontal pre decimation filter control. 0x0 DISABLE — Disable pre-decimation filter. 0x1 DECX2 — Decimate PS by 2. 0x2 DECX4 — Decimate PS by 4. 0x3 DECX8 — Decimate PS by 8.
9–8 DECY	Verticle pre decimation filter control. 0x0 DISABLE — Disable pre-decimation filter. 0x1 DECY2 — Decimate PS by 2. 0x2 DECY4 — Decimate PS by 4. 0x3 DECY8 — Decimate PS by 8.
7 RSVD0	Reserved, always set to zero.
6 WB_SWAP	Swap bytes in words. For each 16 bit word, the two bytes will be swapped.
FORMAT	PS buffer format. To select between YUV and YCbCr formats, see bit 31 of the CSC1_COEF0 register. 0x4 RGB888 — 32-bit pixels (unpacked 24-bit format) 0xC RGB555 — 16-bit pixels 0xD RGB444 — 16-bit pixels 0xE RGB565 — 16-bit pixels 0x10 YUV1P444 — 32-bit pixels (1-plane XYUV unpacked) 0x12 UYVY1P422 — 16-bit pixels (1-plane U0,Y0,V0,Y1 interleaved bytes) 0x13 VYUY1P422 — 16-bit pixels (1-plane V0,Y0,U0,Y1 interleaved bytes) 0x14 Y8 — 8-bit monochrome pixels (1-plane Y luma output) 0x15 Y4 — 4-bit monochrome pixels (1-plane Y luma, 4 bit truncation) 0x18 YUV2P422 — 16-bit pixels (2-plane UV interleaved bytes) 0x19 YUV2P420 — 16-bit pixels (2-plane UV)

Table continues on the next page...

PXP_HW_PXP_PS_CTRL field descriptions (continued)

Field	Description
0x1A	YVU2P422 — 16-bit pixels (2-plane VU interleaved bytes)
0x1B	YVU2P420 — 16-bit pixels (2-plane VU)
0x1E	YUV422 — 16-bit pixels (3-plane format)
0x1F	YUV420 — 16-bit pixels (3-plane format)

42.11.13 PS Input Buffer Address (PXP_HW_PXP_PS_BUF)

PS Input Buffer Address. This should be programmed to the starting address of the RGB data or Y (luma) data for the PS plane.

This register contains the pointer to the Luma/RGB buffer. If the application requires an offset into the PS buffer, then this address can be set so that the desired offset is achieved. Any byte address is valid. For best performance, 64B alignment is recommended.

EXAMPLE

```
REG_PXP_PS_BUF_WR(image_rgb); // RGB image
REG_PXP_PS_BUF_WR(image_y); // Y (luma) image data
REG_PXP_PS_UBUF_WR(image_u); // U (Cb) image data
REG_PXP_PS_VBUF_WR(image_v); // V (Cr) image data
```

Address: 21C_C000h base + C0h offset = 21C_C0C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_PS_BUF field descriptions

Field	Description
ADDR	Address pointer for the PS RGB or Y (luma) input buffer.

42.11.14 PS U/Cb or 2 Plane UV Input Buffer Address (PXP_HW_PXP_PS_UBUF)

PS Chroma (U/Cb/UV) Input Buffer Address. This register points to the beginning of the PS U/Cb input buffer. In two plane operation, this register points to the beginning of the PS UV chroma input buffer.

This register contains the pointer to the Chroma U/Cb or 2 plane UV buffer. This register is unused when processing 1-plane buffer formats. If the application requires an offset into the PS buffer, then this address can be set so that the desired offset is achieved. Any byte address is valid. For best performance, 64B alignment is recommended.

EXAMPLE

```
REG_PS_BUF_WR(image_y); // Y (luma) image data
REG_PS_UBUF_WR(image_u); // U (Cb) image data
REG_PS_VBUF_WR(image_v); // V (Cr) image data
```

Address: 21C_C000h base + D0h offset = 21C_C0D0h

PXP_HW_PXP_PS_UBUF field descriptions

Field	Description
ADDR	Address pointer for the PS U/Cb or 2 plane UV Chroma input buffer.

42.11.15 PS V/Cr Input Buffer Address (PXP_HW_PXP_PS_VBUF)

PS Chroma (V/Cr) Input Buffer Address. This register points to the beginning of the PS V/Cr input buffer. In one or two plane operation, this register is not used. In monochrome modes Y8 and Y4, the low 16 bits are used as the U/V data in the datapath instead of sourcing U/V data from external buffers. In this case, it represents a fixed value for U/V data.

This register contains the pointer to the Chroma V/Cr buffer. For Y8/Y4 modes, the low 16 bits are used as the monochrome U and V values in the data path. Bits [15:8] represent the U data byte, and bits [7:0] represent the V data byte. Other than with Y8/Y4 input buffer formats, this register is unused when processing 1 or 2-plane buffer formats. If the application requires an offset into the PS buffer, then this address can be set so that the desired offset is achieved. Any byte address is valid. For best performance, 64B alignment is recommended.

EXAMPLE

```
REG_PS_BUF_WR(image_y); // Y (luma) image data
REG_PS_UBUF_WR(image_u); // U (Cb) image data
REG_PS_VBUF_WR(image_v); // V (Cr) image data
```

Address: 21C_C000h base + E0h offset = 21C_C0E0h

PXP_HW_PXP_PS_VBUF field descriptions

Field	Description
ADDR	Address pointer for the PS V/Cr Chroma input buffer.

42.11.16 Processed Surface Pitch (PXP_HW_PXP_PS_PITCH)

This register contains the processed surface pitch in bytes.

Any byte value will indicate the vertical pitch of the PS source frame buffer. This value will be used in PS pixel address calculations. This value has no relation to the UL and LR registers. It specifies how many bytes are between two vertically adjacent pixels in the input PS surface. For multi-plane formats, the Y buffer pitch should be programmed. For 2-plane YUV422, the UV pitch is the same as the Y pitch. For 3-plane YUV422, the U and V pitch is 1/2 the Y pitch. For 2-plane YUV420, the UV pitch is 1/2 the Y pitch. For 3-plane YUV420, the U and V pitch is 1/4 the Y pitch. All source buffers should comply with these U and V resolution reductions with respect to their Y source buffers.

EXAMPLE

```
REG_PS_PITCH_WR( 64 * 4 ); // The output buffer pitch is 64 pixels times 32 bits per pixel
```

Address: 21C_C000h base + F0h offset = 21C_C0F0h

PXP_HW_PXP_PS_PITCH field descriptions

Field	Description
31–16 RSVD	Reserved, always set to zero.
PITCH	Indicates the number of bytes in memory between two vertically adjacent pixels.

42.11.17 PS Background Color (PXP_HW_PXP_PS_BACKGROUND_0)

PS Background Pixel Color. This register provides a pixel value used when processing pixels outside of the region specified by the PS Coordinate registers. This value can effectively be used to set the color of the letterboxing region around the PS image. This value is used by the Alpha A block.

This register contains a pixel value to be used for any PS pixels that fall outside the PS extents. This is effectively a background or letterbox color. The CSC1 control and datapath pixel format should be considered when selecting the background color.

EXAMPLE

```
REG_PXP_PS_BACKGROUND_WR(0x00000000); // letterbox is black
REG_PXP_PS_BACKGROUND_WR(0x00800000); // letterbox is dark red
REG_PXP_PS_BACKGROUND_WR(0x00008000); // letterbox is dark green
REG_PXP_PS_BACKGROUND_WR(0x00000080); // letterbox is dark blue
```

Address: 21C_C000h base + 100h offset = 21C_C100h

PXP_HW_PXP_PS_BACKGROUND_0 field descriptions

Field	Description
31-24 RSVD	Reserved, always set to zero.
COLOR	Background color (in 24bpp format) for any pixels not within the buffer range specified by the PS ULC/LRC.

42.11.18 PS Scale Factor Register (PXP_HW_PXP_PS_SCALE)

PS Scale Factor. This register provides the scale factor for the PS buffer.

The maximum down scaling factor is 1/2 such that the output image in either axis is 1/2 the size of the source. The maximum up scaling factor is 2^12 for either axis. The reciprocal of the scale factor should be loaded into this register. To reduce the PS buffer by a factor of two in the output frame buffer, a value of 10.0000_0000_0000 should be

loaded into this register. To scale up by a factor of 4, the value of 1/4, or 00.0100_0000_0000, should be loaded into this register. To scale up by 8/5, the value of 00.1010_0000_0000 should be loaded.

EXAMPLE

```
REG_PS_SCALE_WR(0x10001000); // 1:1 scaling (0x1.000)
REG_PS_SCALE_WR(0x08000800); // 2x scaling (0x0.800)
REG_PS_SCALE_WR(0x20002000); // 1/2x scaling (0x2.000)
```

Address: 21C_C000h base + 110h offset = 21C_C110h

PXP_HW_PXP_PS_SCALE field descriptions

Field	Description
31 RSVD2	Reserved, always set to zero.
30–16 YSCALE	This is a two bit integer and 12 bit fractional representation (##.####_####_####) of the Y scaling factor for the PS source buffer. The maximum value programmed should be 2 since scaling down by a factor greater than 2 is not supported with the bilinear filter. Decimation and the bilinear filter should be used together to achieve scaling by more than a factor of 2.
15 RSVD1	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_PS_SCALE field descriptions (continued)

Field	Description
XSCALE	This is a two bit integer and 12 bit fractional representation (##.####_####_####) of the X scaling factor for the PS source buffer. The maximum value programmed should be 2 since scaling down by a factor greater than 2 is not supported with the bilinear filter. Decimation and the bilinear filter should be used together to achieve scaling by more than a factor of 2.

42.11.19 PS Scale Offset Register (PXP_HW_PXP_PS_OFFSET)

PS Scale Offset. This register provides the initial scale offset for the PS buffer.

The X and Y offset provides the ability to access the source image with a per sub-pixel granularity. This provides the capability to use all source pixels to effect the output PS image. The fixed offset values can be used for sub-pixel adjustments in the bilinear scaling filter. For example, when scaling an image down by a factor of 2, an initial offset of 0x0 would result in sub-sampling every other pixel. If a fixed offset of 0x800 (1/2), all pixels are used in scaling the final output pixel value. In this case, the first output pixel would be the sum of (1/2*P0) + (1/2*P1). This fixed offset is applied after the decimation filter stage, and before the bilinear filter stage.

EXAMPLE

```
REG_PS_SCALE_WR(0x2000_2000); // 1/2x scaling (0x2.000)
REG_PS_OFFSET_WR(0x0800_0800); // half-pixel offset in both X and Y to ensure averaging versus pixel decimation
```

Address: 21C_C000h base + 120h offset = 21C_C120h

PXP_HW_PXP_PS_OFFSET field descriptions

Field	Description
31–28 RSVD2	Reserved, always set to zero.
27–16 YOFFSET	This is a 12 bit fractional representation (0.####_####_####) of the Y scaling offset. This represents a fixed pixel offset which gets added to the scaled address to determine source data for the scaling engine.
15–12 RSVD1	Reserved, always set to zero.
XOFFSET	This is a 12 bit fractional representation (0.####_####_####) of the X scaling offset. This represents a fixed pixel offset which gets added to the scaled address to determine source data for the scaling engine.

42.11.20 PS Color Key Low (PXP_HW_PXP_PS_CLRKEYLOW_0)

This register contains the color key low value for the PS buffer. This value is used by the Alpha A block.

When processing an image, if the PXP finds a pixel in the PS buffer with a color that falls in the range between REG_PS_CLRKEYLOW and REG_PS_CLRKEYHIGH, it will insert the pixel from the AS channel. If the current AS pixel is letterboxed or if the AS also matches its colorkey range, the REG_PS_BACKGROUND color is passed down the pixel pipeline.

EXAMPLE

```
// colorkey values between
REG_PS_CLRKEYLOW_WR (0x008000); // medium green and
REG_PS_CLRKEYHIGH_WR(0x00FF00); // light green
```

Address: 21C_C000h base + 130h offset = 21C_C130h

PXP_HW_PXP_PS_CLRKEYLOW_0 field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of color key applied to PS buffer. To disable PS colorkeying, set the low colorkey to 0xFFFFFFFF and the high colorkey to 0x000000.

42.11.21 PS Color Key High (PXP_HW_PXP_PS_CLRKEYHIGH_0)

This register contains the color key high value for the PS buffer. This value is used by the Alpha A block.

When processing an image, if the PXP finds a pixel in the PS buffer with a color that falls in the range between REG_PS_CLRKEYLOW and REG_PS_CLRKEYHIGH, it will insert the pixel from the AS channel. If the current AS pixel is letterboxed or if the AS also matches its colorkey range, the REG_PS_BACKGROUND color is passed down the pixel pipeline.

EXAMPLE

```

// colorkey values between
REG_PS_CLRKEYLOW_WR (0x008000); // medium green and
REG_PS_CLRKEYHIGH_WR(0x00FF00); // light green
    
```

Address: 21C_C000h base + 140h offset = 21C_C140h

PXP_HW_PXP_PS_CLRKEYHIGH_0 field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of color key applied to PS buffer. To disable PS colorkeying, set the low colorkey to 0xFFFFFFFF and the high colorkey to 0x000000.

42.11.22 Alpha Surface Control (PXP_HW_PXP_AS_CTRL)

This register contains buffer control for the Alpha Surface 0 input buffer.

Control register to determine AS buffer processing.

EXAMPLE

```

u32 asparam;
asparam = BF_PXP_ASPARAM_ENABLE (1);
asparam |= BF_PXP_ASPARAM_ALPHA_CTRL (BV_PXP_ASPARAM_ALPHA_CTRL_ROPs);
asparam |= BF_PXP_ASPARAM_FORMAT (BV_PXP_ASPARAM_FORMAT_ARGB8888);
asparam |= BF_PXP_ASPARAM_ROP (BV_PXP_ASPARAM_ROP_XORAS);
REG_ASPARAM_WR (0,asparam); // enable alpha surface to perform XOR ROP using RGB8888 AS
pixel format
    
```

Address: 21C_C000h base + 150h offset = 21C_C150h

PXP_HW_PXP_AS_CTRL field descriptions

Field	Description
31–22 RSVD1	Reserved, always set to zero.
21 ALPHA1_INVERT	Setting this bit to logic 0 will not alter the alpha1 value. A logic 1 will invert the alpha1 value and apply (1-alpha) for image composition.
20 ALPHA0_INVERT	Setting this bit to logic 0 will not alter the alpha0 value. A logic 1 will invert the alpha0 value and apply (1-alpha) for image composition.
19–16 ROP	Indicates a raster operation to perform when enabled. Raster operations are enabled through the ALPHA_CTRL field. 0x0 MASKAS — AS AND PS

Table continues on the next page...

PXP_HW_PXP_AS_CTRL field descriptions (continued)

Field	Description
	0x1 MASKNOTAS — nAS AND PS 0x2 MASKASNOT — AS AND nPS 0x3 MERGEAS — AS OR PS 0x4 MERGENOTAS — nAS OR PS 0x5 MERGEASNOT — AS OR nPS 0x6 NOTCOPYAS — nAS 0x7 NOT — nPS 0x8 NOTMASKAS — AS NAND PS 0x9 NOTMERGEAS — AS NOR PS 0xA XORAS — AS XOR PS 0xB NOTXORAS — AS XNOR PS
15–8 ALPHA	Alpha modifier used when the ALPHA_MULTIPLY or ALPHA_OVERRIDE values are programmed in REG_AS_CTRL[ALPHA_CTRL]. The output alpha value will either be replaced (ALPHA_OVERRIDE) or scaled (ALPHA_MULTIPLY) when selected.
7–4 FORMAT	Indicates the input buffer format for AS. 0x0 ARGB8888 — 32-bit pixels with alpha 0x1 RGBA8888 — 32-bit pixels with alpha 0x4 RGB888 — 32-bit pixels without alpha (unpacked 24-bit format) 0x8 ARGB1555 — 16-bit pixels with alpha 0x9 ARGB4444 — 16-bit pixels with alpha 0xC RGB555 — 16-bit pixels without alpha 0xD RGB444 — 16-bit pixels without alpha 0xE RGB565 — 16-bit pixels without alpha
3 ENABLE_ COLORKEY	Indicates that colorkey functionality is enabled for this alpha surface. Pixels found in the alpha surface colorkey range will be displayed as transparent (the PS pixel will be used).
2–1 ALPHA_CTRL	Determines how the alpha value is constructed for this alpha surface. Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. 0x0 Embedded — Indicates that the AS pixel alpha value will be used to blend the AS with PS. The ALPHA field is ignored. 0x1 Override — Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. 0x2 Multiply — Indicates that the value in the ALPHA field should be used to scale all pixel alpha values. Each pixel alpha is multiplied by the value in the ALPHA field. 0x3 ROPs — Enable ROPs. The ROP field indicates an operation to be performed on the alpha surface and PS pixels.
0 RSVD0	Reserved, always set to zero.

42.11.23 Alpha Surface Buffer Pointer (PXP_HW_PXP_AS_BUF)

Alpha Surface 0 Buffer Address Pointer. This register points to the beginning of the Alpha Surface 0 input buffer.

This register is used to indicate the base address of the AS buffer.

EXAMPLE

```
u32* alpha_ptr;
REG_ASn_WR(0, alpha_ptr);
```

Address: 21C_C000h base + 160h offset = 21C_C160h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_AS_BUF field descriptions

Field	Description
ADDR	Address pointer for the alpha surface 0 buffer.

42.11.24 Alpha Surface Pitch (PXP_HW_PXP_AS_PITCH)

This register contains the alpha surface pitch in bytes.

Any byte value will indicate the vertical pitch. This value will be used in AS pixel address calculations. This value has no relation to the UL and LR registers. It specifies how many bytes are between two vertically adjacent pixels in the input AS surface.

EXAMPLE

```
REG_AS_PITCH_WR( 1920 * 4 ); // The output buffer pitch is HD resolution at 32 bits per pixel
```

Address: 21C_C000h base + 170h offset = 21C_C170h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_AS_PITCH field descriptions

Field	Description
31–16 RSVD	Reserved, always set to zero.
PITCH	Indicates the number of bytes in memory between two vertically adjacent pixels.

42.11.25 Overlay Color Key Low (PXP_HW_PXP_AS_CLRKEYLOW_0)

This register contains the color key low value for the AS buffer. This value is used by the Alpha A block.

When processing an image, the if the PXP finds a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. If no PS image is present or if the PS image also matches its colorkey range, the PS background color is used. Colorkey operations are higher priority than alpha or ROP operations.

EXAMPLE

```

// colorkey values between
REG_AS_CLRKEYLOW_WR (0x000000); // black and
REG_AS_CLRKEYHIGH_WR(0x800000); // medium red
    
```

Address: 21C_C000h base + 180h offset = 21C_C180h

PXP_HW_PXP_AS_CLRKEYLOW_0 field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of RGB color key applied to AS buffer. Each overlay has an independent colorkey enable.

42.11.26 Overlay Color Key High (PXP_HW_PXP_AS_CLRKEYHIGH_0)

This register contains the color key high value for the AS buffer. This value is used by the Alpha A block.

When processing an image, the if the PXP finds a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. If no PS image is present or if the PS image also matches its colorkey range, the PS background color is used. Colorkey operations are higher priority than alpha or ROP operations.

EXAMPLE

```

// colorkey values between
REG_AS_CLRKEYLOW_WR (0x000000); // black and
REG_AS_CLRKEYHIGH_WR(0x800000); // medium red

```

Address: 21C_C000h base + 190h offset = 21C_C190h

**PXP_HW_PXP_AS_CLRKEYHIGH_0 field descriptions**

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of RGB color key applied to AS buffer. Each overlay has an independent colorkey enable.

42.11.27 Color Space Conversion Coefficient Register 0 (PXP_HW_PXP_CSC1_COEF0)

This register contains color space conversion coefficients in two's complement notation.

The Coefficient 0 register contains coefficients used in the color space conversion algorithm. The Y and UV offsets are added to the source buffer to normalize them before the conversion. C0 is the coefficient that is used to multiply the luma component of the data for all three RGB components.

EXAMPLE

```

// The equations used for Colorspace conversion are:
//   R = C0*(Y+YOFFSET) + C1(V+UV_OFFSET)
//   G = C0*(Y+YOFFSET) + C3(U+UV_OFFSET) + C2(V+UV_OFFSET)
//   R = C0*(Y+YOFFSET) + C4(U+UV_OFFSET)

REG_CSCCOEF0_WR(0x04030000); // YUV coefficients: C0, Yoffset, Uvoffset
REG_CSCCOEF1_WR(0x01230208); // YUV coefficients: C1, C4
REG_CSCCOEF2_WR(0x076B079b); // YUV coefficients: C2, C3

```

PXP Memory Map/Register Definition

Address: 21C_C000h base + 1A0h offset = 21C_C1A0h

PXP_HW_PXP_CSC1_COEF0 field descriptions

Field	Description
31 YCBCR_MODE	Set to 1 when performing YCbCr conversion to RGB. Set to 0 when converting YUV to RGB data. This bit changes the behavior of the scaler when performing U/V scaling.
30 BYPASS	Bypass the CSC unit in the scaling engine. When set to logic 1, bypass is enabled and the output pixels will be in the YUV/YCbCr color space. When set to logic 0, the CSC unit is enabled and the pixels will be converted based on the programmed coefficients.
29 RSVD1	Reserved, always set to zero.
28–18 C0	Two's compliment Y multiplier coefficient. YUV=0x100 (1.000) YCbCr=0x12A (1.164)
17–9 UV_OFFSET	Two's compliment phase offset implicit for CbCr data. Generally used for YCbCr to RGB conversion. YCbCr=0x180, YUV=0x000 (typically -128 or 0x180 to indicate normalized -0.5 to 0.5 range)
Y_OFFSET	Two's compliment amplitude offset implicit in the Y data. For YUV, this is typically 0 and for YCbCr, this is typically -16 (0x1F0)

42.11.28 Color Space Conversion Coefficient Register 1 (PXP_HW_PXP_CSC1_COEF1)

This register contains color space conversion coefficients in two's complement notation.

The Coefficient 1 register contains coefficients used in the color space conversion algorithm. C1 is the coefficient that is used to multiply the chroma (Cr/V) component of the data for the red component. C4 is the coefficient that is used to multiply the chroma (Cb/U) component of the data for the blue component. Both values should be coded as a two's complement fixed point number with 8 bits right of the decimal.

EXAMPLE

```
REG_CSCCOEF0_WR(0x04030000); // YUV coefficients: C0, Yoffset, UYoffset
REG_CSCCOEF1_WR(0x01230208); // YUV coefficients: C1, C4
REG_CSCCOEF2_WR(0x076B079b); // YUV coefficients: C2, C3
```

Address: 21C_C000h base + 1B0h offset = 21C_C1B0h

PXP_HW_PXP_CSC1_COEF1 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 C1	Two's complement Red V/Cr multiplier coefficient. YUV=0x123 (1.140) YCbCr=0x198 (1.596)
15–11 RSVD0	Reserved, always set to zero.
C4	Two's complement Blue U/Cb multiplier coefficient. YUV=0x208 (2.032) YCbCr=0x204 (2.017)

42.11.29 Color Space Conversion Coefficient Register 2 (PXP_HW_PXP_CSC1_COEF2)

This register contains color space conversion coefficients in two's complement notation.

The Coefficient 2 register contains coefficients used in the color space conversion algorithm. C2 is the coefficient that is used to multiply the chroma (Cr/V) component of the data for the green component. C3 is the coefficient that is used to multiply the chroma (Cb/U) component of the data for the green component. Both values should be coded as a two's compliment fixed point number with 8 bits right of the decimal.

EXAMPLE

// NOTE: The default values for the CSCCOEF2 register are incorrect. C2 should be 0x76B and C3 should be 0x79C for proper operation.

```
REG_CSCCOEF0_WR(0x04030000); // YUV coefficients: C0, Yoffset, UYoffset
REG_CSCCOEF1_WR(0x01230208); // YUV coefficients: C1, C4
REG_CSCCOEF2_WR(0x076B079b); // YUV coefficients: C2, C3
```

Address: 21C_C000h base + 1C0h offset = 21C_C1C0h

PXP_HW_PXP_CSC1_COEF2 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 C2	Two's compliment Green V/Cr multiplier coefficient. YUV=0x76B (-0.581) YCbCr=0x730 (-0.813)
15–11 RSVD0	Reserved, always set to zero.
C3	Two's compliment Green U/Cb multiplier coefficient. YUV=0x79C (-0.394) YCbCr=0x79C (-0.392)

42.11.30 Color Space Conversion Control Register. (PXP_HW_PXP_CSC2_CTRL)

This register contains the control registers to configure the CSC module.

The CSC control register will configure the CSC module to perform color space conversion between the RGB/YUV/YCbCr color spaces.

EXAMPLE

```
//Converting from YUV/YCbCr color spaces to the RGB color space uses the
//following equation structure:
//
// R = A1(Y-D1) + A2(U-D2) + A3(V-D3)
```

```
// G = B1(Y-D1) + B2(U-D2) + B3(V-D3)
// B = C1(Y-D1) + C2(U-D2) + C3(V-D3)
//
//Converting from the RGB color space to YUV/YCbCr color spaces uses the
//following equation structure:
//
// Y = A1*R + A2*G + A3*B + D1
// U = B1*R + B2*G + B3*B + D2
// V = C1*R + C2*G + C3*B + D3
//
//All math is signed, so all coefficients come in as two's comp numbers
//
```

Address: 21C_C000h base + 1D0h offset = 21C_C1D0h

PXP_HW_PXP_CSC2_CTRL field descriptions

Field	Description
31–3 RSVD	Reserved, always set to zero.
2–1 CSC_MODE	This field controls how the CSC unit operates on pixels when the CSC is not bypassed. 0x0 YUV2RGB — Convert from YUV to RGB. 0x1 YCbCr2RGB — Convert from YCbCr to RGB. 0x2 RGB2YUV — Convert from RGB to YUV. 0x3 RGB2YCbCr — Convert from RGB to YCbCr.
0 BYPASS	This bit controls whether the pixels entering the CSC2 unit get converted or not. When BYPASS is set, no operations occur on the pixels. When BYPASS is cleared, the selected CSC operation takes place.

42.11.31 Color Space Conversion Coefficient Register 0 (PXP_HW_PXP_CSC2_COEF0)

This register contains color space conversion coefficients in two's compliment notation.

Address: 21C_C000h base + 1E0h offset = 21C_C1E0h

PXP_HW_PXP_CSC2_COEF0 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 A2	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.
15–11 RSVD0	Reserved, always set to zero.
A1	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

42.11.32 Color Space Conversion Coefficient Register 1 (PXP_HW_PXP_CSC2_COEF1)

This register contains color space conversion coefficients in two's compliment notation.

Address: 21C_C000h base + 1F0h offset = 21C_C1F0h

PXP_HW_PXP_CSC2_COEF1 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 B1	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

Table continues on the next page...

PXP_HW_PXP_CSC2_COEF1 field descriptions (continued)

Field	Description
15–11 RSVD0	Reserved, always set to zero.
A3	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

42.11.33 Color Space Conversion Coefficient Register 2 (PXP_HW_PXP_CSC2_COEF2)

This register contains color space conversion coefficients in two's compliment notation.

Address: 21C_C000h base + 200h offset = 21C_C200h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_CSC2_COEF2 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 B3	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.
15–11 RSVD0	Reserved, always set to zero.
B2	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

42.11.34 Color Space Conversion Coefficient Register 3 (PXP_HW_PXP_CSC2_COEF3)

This register contains color space conversion coefficients in two's compliment notation.

Address: 21C_C000h base + 210h offset = 21C_C210h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_CSC2_COEF3 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 C2	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.
15–11 RSVD0	Reserved, always set to zero.
C1	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

42.11.35 Color Space Conversion Coefficient Register 4 (PXP_HW_PXP_CSC2_COEF4)

This register contains color space conversion coefficients in two's compliment notation.

Address: 21C_C000h base + 220h offset = 21C_C220h

PXP_HW_PXP_CSC2_COEF4 field descriptions

Field	Description
31–25 RSVD1	Reserved, always set to zero.
24–16 D1	Two's compliment coefficient integer offset to be added.
15–11 RSVD0	Reserved, always set to zero.
C3	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

42.11.36 Color Space Conversion Coefficient Register 5 (PXP_HW_PXP_CSC2_COEF5)

This register contains color space conversion coefficients in two's compliment notation.

Address: 21C_C000h base + 230h offset = 21C_C230h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_CSC2_COEF5 field descriptions

Field	Description
31–25 RSVD1	Reserved, always set to zero.
24–16 D3	Two's compliment coefficient integer offset to be added.
15–9 RSVD0	Reserved, always set to zero.
D2	Two's compliment D1 coefficient integer offset to be added.

42.11.37 Lookup Table Control Register. (PXP_HW_PXP_LUT_CTRL)

This register is used to access/control the Monochrome Lookup table.

The Y8 LUT input mode will take the high order data path byte and transform it using the LUT memory. This is an 8-bit to 8-bit transformation. The two low order bytes bypass the LUT and are not transformed, but bypassed without modification. This option can be used for monochrome gamma correction. The Direct Lookup mode will use the high nibble of each data byte and truncate the low nibble to generate the lookup address, i.e. $R[7:0]G[7:0]B[7:0] \rightarrow R[7:4]G[7:4]B[7:4]$. 4K pixels (12-bit address) with 2 bytes per pixel is supported in this mode. Cached Lookup mode will use the high order bits, $R[7:3], G[7:2], B[7:3]$ or RGB565, to address the cached LUT memory. 64KB LUT tables, using 16KB of internal LUT memory, can be indirectly transformed to 16-bit output pixels (as in RGBW4444/RGB565). This is used for 16bpp gamma correction or EPD color panel support. Cache misses are internally managed by the PXP LUT Cache controller.

PXP Memory Map/Register Definition

Address: 21C_C000h base + 240h offset = 21C_C240h

PXP_HW_PXP_LUT_CTRL field descriptions

Field	Description
31 BYPASS	Setting this bit will bypass the LUT memory resource completely. No pixel transformations will occur at this stage of the PXP pixel rprocessing pipeline.
30–26 RSVD3	Reserved, always set to zero.
25–24 LOOKUP_MODE	<p>Configure the input address for the 16KB LUT memory. The address into the LUT uses different parts of the pixel data path bytes. The data path is defined as three bytes, conceptually as RGB/YUV/YCbCr[23:0]. Also referred to as R/Y[7:0],G/U[7:0],B/V[7:0]</p> <p>0x0 CACHE_RGB565 — LUT ADDR = R[7:3],G[7:2],B[7:3]. Use all 16KB of LUT for indirect cached 128KB lookup.</p> <p>0x1 DIRECT_Y8 — LUT ADDR = 16'b0,Y[7:0]. Use only the first 256 bytes of LUT. Only the Y, or third data path byte, is tranformed.</p> <p>0x2 DIRECT_RGB444 — LUT ADDR = R[7:4],G[7:4],B[7:4]. Use one 8KB bank of LUT selected by SEL_8KB.</p> <p>0x3 DIRECT_RGB454 — LUT ADDR = R[7:4],G[7:3],B[7:4]. Use all 16KB of LUT.</p>
23–18 RSVD2	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_LUT_CTRL field descriptions (continued)

Field	Description
17–16 OUT_MODE	Select the output mode of operation for the LUT resource. There are four bytes [3-0] in the data path at the output of the LUT resource. Byte lane 3 is always bypassed and usually contains an alpha value. The LUT can be programmed to transform bytes 2,1,0 according to the options available in this field. 0x0 RESERVED — Reserved, not valid when using the LUT to transform pixels. 0x1 Y8 — R/Y byte lane 2 lookup, bytes 1,0 bypassed. 0x2 RGBW4444CFA — Byte lane 2 = CFA_Y8, byte lane 1,0 = RGBW4444. 0x3 RGB888 — RGB565->RGB888 conversion for Gamma correction.
15–11 RSVD1	Reserved, always set to zero.
10 SEL_8KB	Selects which 8KB bank of memory to use for direct 12bpp lookup modes. Logic 0 indicates first 8KB, logic 1 indicates second 8KB. Two direct LUT arrays can be stored and one can be selected for a given PXP operation.
9 LRU_UPD	Least Recently Used Policy Update Control: 1=> block LRU update for hit after miss. 0=> update LRU for all hits including hit after miss.
8 INVALID	Invalidate the cache LRU and valid bits. This bit will automatically reset when set to a logic 1.
7–1 RSVD0	Reserved, always set to zero.
0 DMA_START	Setting this bit will result in the DMA operation to load the PXP LUT memory based on REG_LUT_ADDR_NUM_BYTES, REG_LUT_ADDR_ADDR, and REG_LUT_MEM_ADDR. This bit will automatically reset when set to a logic 1. Note: The LOOKUP_MODE must not be set to CACHE_RGB565 when starting and performing DMA transfers.

42.11.38 Lookup Table Control Register. (PXP_HW_PXP_LUT_ADDR)

This register is used to access/control the Monochrome Lookup table.

The Y8 LUT input mode will take the high order data path byte and transform it using the LUT memory. This is an 8-bit to 8-bit transformation. The two low order bytes bypass the LUT and are not transformed, but bypassed without modification. This option can be used for monochrome gamma correction. The Direct Lookup mode will use the high nibble of each data byte and truncate the low nibble to generate the lookup address, i.e. R[7:0]G[7:0]B[7:0] -> R[7:4]G[7:4]B[7:4]. 4K pixels (12-bit address) with 2 bytes per pixel is supported in this mode. Cached Lookup mode will use the high order bits, R[7:3],G[7:2],B[7:3] or RGB565, to address the cached LUT memory. 64KB LUT tables, using 16KB of internal LUT memory, can be indirectly transformed to 16-bit output

PXP Memory Map/Register Definition

pixels (as in RGBW4444/RGB565). This is used for 16bpp gamma correction or EPD color panel support. Cache misses are internally managed by the PXP LUT Cache controller.

Address: 21C_C000h base + 250h offset = 21C_C250h

PXP_HW_PXP_LUT_ADDR field descriptions

Field	Description
31 RSVD2	Reserved, always set to zero.
30–16 NUM_BYTES	Indicates the number of bytes to load via a DMA operation. This field must be divisible by 8 and the least significant 3 bits must be 0. The value 8 indicates load 8 bytes from the external address indicated by REG_LUT_MEM_ADDR to the LUT memory location indicated by REG_LUT_CTRL_ADDR.
15–14 RSVD1	Reserved, always set to zero.
ADDR	LUT indexed address pointer. This address into the LUT memory is always four byte aligned for PIO access, and eight byte aligned for DMA access. The least two significant bits are not used to drive the LUT memory array. For PIO LUT access, when the LUT data register is written, the contents of the LUT at the address specified by this address field will be loaded with a 32-bit DWORD. This address pointer will be incremented after the LUT data is written. This will provide recursive writes to the LUT data register to initialize the entire LUT array with recursive writes to the LUT data register. For DMA access, this register indicates the LUT memory address of the 8 byte QWORD to be loaded. When using the NUM_BYTES field to load more than 8 bytes, the register should be programmed with the first LUT memory location to be filled and each load of the LUT memory will increment this address field until NUM_BYTES has been loaded.

42.11.39 Lookup Table Data Register. (PXP_HW_PXP_LUT_DATA)

This register is used to load data into the lookup table.

Address: 21C_C000h base + 260h offset = 21C_C260h

PXP_HW_PXP_LUT_DATA field descriptions

Field	Description
DATA	Writing this field will load 4 bytes, aligned to four byte boundaries, of data indexed by the ADDR field of the REG_LUT_CTRL register.

42.11.40 Lookup Table External Memory Address Register. (PXP_HW_PXP_LUT_EXTMEM)

This register is used as the external memory base address for LUT data transfers.

For DMA LUT memory loads, this is the base address from which data will be sourced to store into the LUT memory array. For Cached LUT memory pixel transformations, this register will store the base address of the full 64K pixel LUT translation table.

Address: 21C_C000h base + 270h offset = 21C_C270h

PXP_HW_PXP_LUT_EXTMEM field descriptions

Field	Description
ADDR	This register contains the external memory address used for LUT memory operation.

42.11.41 Color Filter Array Register. (PXP_HW_PXP_CFA)

This register contains the pattern of the CFA mapping within PXP macro blocks.

PXP Memory Map/Register Definition

There are sixteen 2 bit values in this register each mapping a selected component to the output pixel. The two bit values are defined as 0=>R, 1=>G, 2=>B, and 3=>W. The first byte represents the repetitive pattern of RGBW pixels in the CFA for the first line segment of each processed PXP block. The second byte represents the pattern in the second line segment of the block, and so on. The first byte repeats two times for 8x8 macro block mode, and repeats four times for 16x16 block mode.

Address: 21C_C000h base + 280h offset = 21C_C280h

PXP_HW_PXP_CFA field descriptions

Field	Description
DATA	This register contains the Color Filter Array pattern for decimation of RGBW4444 16 bit pixels to individual R, G, B, W values. The pattern represents a replicated 4x4 color filter array for the entire output frame buffer.

42.11.42 PXP Alpha Engine A Control Register. (PXP_HW_PXP_ALPHA_A_CTRL)

This register controls alpha blending function in PXP.

Address: 21C_C000h base + 290h offset = 21C_C290h

PXP_HW_PXP_ALPHA_A_CTRL field descriptions

Field	Description
31–24 S1_GLOBAL_ALPHA	s1 global alpha
23–16 S0_GLOBAL_ALPHA	s0 global alpha
15–14 RSVD0	Reserved, always set to zero.
13 S1_COLOR_MODE	s1 color mode 0x0 0 — straight mode for s1 color 0x1 1 — multiply mode for s1 color
12 S1_ALPHA_MODE	s1 alpha mode 0x0 0 — straight mode for s1 alpha 0x1 1 — inversed mode for s1 alpha
11–10 S1_GLOBAL_ALPHA_MODE	s1 global alpha mode 0x0 0 — using global alpha. 0x0 1 — using local alpha. 0x0 2 — using scaled alpha. 0x0 3 — using scaled alpha.
9–8 S1_S0_FACTOR_MODE	s1 to s0 factor mode 0x0 0 — using 1.

Table continues on the next page...

PXP_HW_PXP_ALPHA_A_CTRL field descriptions (continued)

Field	Description
	0x1 1 — using 0. 0x2 2 — using straight alpha. 0x3 3 — using inverse alpha.
7 RSVD1	Reserved, always set to zero.
6 S0_COLOR_ MODE	s0 color mode 0x0 0 — straight mode for s0 color 0x1 1 — multiply mode for s0 color
5 S0_ALPHA_ MODE	s0 alpha mode 0x0 0 — straight mode for s0 alpha 0x1 1 — inversed mode for s0 alpha
4–3 S0_GLOBAL_ ALPHA_MODE	s0 global alpha mode 0x0 0 — using global alpha. 0x1 1 — using local alpha. 0x2 2 — using scaled alpha. 0x3 3 — using scaled alpha.
2–1 S0_S1_ FACTOR_MODE	s0 to s1 factor mode 0x0 0 — using 1. 0x1 1 — using 0. 0x2 2 — using straight alpha. 0x3 3 — using inverse alpha.
0 POTER_DUFF_ ENABLE	poter_duff enable 0x0 0 — porter duff disable. 0x1 1 — porter duff enable.

**42.11.43 PXP Alpha Engine B Control Register.
(PXP_HW_PXP_ALPHA_B_CTRL)**

This register controls alpha blending function in PXP.

Address: 21C_C000h base + 2A0h offset = 21C_C2A0h

PXP_HW_PXP_ALPHA_B_CTRL field descriptions

Field	Description
31–24 S1_GLOBAL_ALPHA	s1 global alpha
23–16 S0_GLOBAL_ALPHA	s0 global alpha
15–14 RSVD0	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_ALPHA_B_CTRL field descriptions (continued)

Field	Description
13 S1_COLOR_MODE	s1 color mode 0x0 0 — straight mode for s1 color 0x1 1 — multiply mode for s1 color
12 S1_ALPHA_MODE	s1 alpha mode 0x0 0 — straight mode for s1 alpha 0x1 1 — inversed mode for s1 alpha
11–10 S1_GLOBAL_ALPHA_MODE	s1 global alpha mode 0x0 0 — using global alpha. 0x1 1 — using local alpha. 0x2 2 — using scaled alpha. 0x3 3 — using scaled alpha.
9–8 S1_S0_FACTOR_MODE	s1 to s0 factor mode 0x0 0 — using 1. 0x1 1 — using 0. 0x2 2 — using straight alpha. 0x3 3 — using inverse alpha.
7 RSVD1	Reserved, always set to zero.
6 S0_COLOR_MODE	s0 color mode 0x0 0 — straight mode for s0 color 0x1 1 — multiply mode for s0 color
5 S0_ALPHA_MODE	s0 alpha mode 0x0 0 — straight mode for s0 alpha 0x1 1 — inversed mode for s0 alpha
4–3 S0_GLOBAL_ALPHA_MODE	s0 global alpha mode 0x0 0 — using global alpha. 0x1 1 — using local alpha. 0x2 2 — using scaled alpha. 0x3 3 — using scaled alpha.
2–1 S0_S1_FACTOR_MODE	s0 to s1 factor mode 0x0 0 — using 1. 0x1 1 — using 0. 0x2 2 — using straight alpha. 0x3 3 — using inverse alpha.
0 POTER_DUFF_ENABLE	poter_duff enable 0x0 0 — porter duff disable. 0x1 1 — porter duff enable.

42.11.44 PXP_HW_PXP_ALPHA_B_CTRL_1

This register defines software define pixels for alpha blending.

This register defines alpha1 legacy blending parameters.

EXAMPLE

Address: 21C_C000h base + 2B0h offset = 21C_C2B0h

PXP_HW_PXP_ALPHA_B_CTRL_1 field descriptions

Field	Description
31–8 RSVD0	Reserved, always set to zero.
7–4 ROP	Indicates a raster operation to perform when enabled. 0x0 MASKAS — AS AND PS 0x1 MASKNOTAS — nAS AND PS 0x2 MASKASNOT — AS AND nPS

Table continues on the next page...

PXP_HW_PXP_ALPHA_B_CTRL_1 field descriptions (continued)

Field	Description
0x3	MERGEAS — AS OR PS
0x4	MERGENOTAS — nAS OR PS
0x5	MERGEASNOT — AS OR nPS
0x6	NOTCOPYAS — nAS
0x7	NOT — nPS
0x8	NOTMASKAS — AS NAND PS
0x9	NOTMERGEAS — AS NOR PS
0xA	XORAS — AS XOR PS
0xB	NOTXORAS — AS XNOR PS
3–2 RSVD1	Reserved, always set to zero.
1 OL_CLRKEY_ENABLE	Indicates that colorkey functionality is enabled for this alpha surface. Pixels found in the alpha surface colorkey range will be displayed as transparent (the PS pixel will be used).
0 ROP_ENABLE	ROP ENABLE

42.11.45 PS Background Color 1 (PXP_HW_PXP_PS_BACKGROUND_1)

PS Background Pixel Color. This register provides a pixel value used when processing pixels outside of the region specified by the PS Coordinate registers. This value can effectively be used to set the color of the letterboxing region around the PS image. This value is used by the Alpha B block.

This register contains a pixel value to be used for any PS pixels that fall outside the PS extents. This is effectively a background or letterbox color. The CSC1 control and datapath pixel format should be considered when selecting the background color.

EXAMPLE

```
REG_PS_BACKGROUND_WR(0x00000000); // letterbox is black
REG_PS_BACKGROUND_WR(0x00800000); // letterbox is dark red
REG_PS_BACKGROUND_WR(0x00008000); // letterbox is dark green
REG_PS_BACKGROUND_WR(0x00000080); // letterbox is dark blue
```

Address: 21C_C000h base + 2C0h offset = 21C_C2C0h

PXP_HW_PXP_PS_BACKGROUND_1 field descriptions

Field	Description
31–24 RSVD	Reserved, always set to zero.
COLOR	Background color (in 24bpp format) for any pixels not within the buffer range specified by the PS ULC/LRC.

**42.11.46 PS Color Key Low 1
(PXP_HW_PXP_PS_CLRKEYLOW_1)**

This register contains the color key low value for the PS buffer 1. This value is used by the Alpha B block.

When processing an image, if the PXP finds a pixel in the PS buffer with a color that falls in the range between REG_PS_CLRKEYLOW and REG_PS_CLRKEYHIGH, it will insert the pixel from the AS channel. If the current AS pixel is letterboxed or if the AS also matches its colorkey range, the REG_PS_BACKGROUND color is passed down the pixel pipeline.

EXAMPLE

```

// colorkey values between
REG_PS_CLRKEYLOW_WR (0x008000); // medium green and
REG_PS_CLRKEYHIGH_WR(0x00FF00); // light green

```

Address: 21C_C000h base + 2D0h offset = 21C_C2D0h

**PXP_HW_PXP_PS_CLRKEYLOW_1 field descriptions**

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of color key applied to PS buffer. To disable PS colorkeying, set the low colorkey to 0xFFFFFFFF and the high colorkey to 0x000000.

42.11.47 PS Color Key High 1 (PXP_HW_PXP_PS_CLRKEYHIGH_1)

This register contains the color key high value for the PS buffer. This value is used by the Alpha B block.

When processing an image, if the PXP finds a pixel in the PS buffer with a color that falls in the range between REG_PS_CLRKEYLOW and REG_PS_CLRKEYHIGH, it will insert the pixel from the AS channel. If the current AS pixel is letterboxed or if the AS also matches its colorkey range, the REG_PS_BACKGROUND color is passed down the pixel pipeline.

EXAMPLE

```

// colorkey values between
REG_PS_CLRKEYLOW_WR (0x008000); // medium green and
REG_PS_CLRKEYHIGH_WR(0x00FF00); // light green
    
```

Address: 21C_C000h base + 2E0h offset = 21C_C2E0h

PXP_HW_PXP_PS_CLRKEYHIGH_1 field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of color key applied to PS buffer. To disable PS colorkeying, set the low colorkey to 0xFFFFFFFF and the high colorkey to 0x000000.

42.11.48 Overlay Color Key Low (PXP_HW_PXP_AS_CLRKEYLOW_1)

This register contains the color key low value for the AS buffer. This value is used by the Alpha B block.

When processing an image, the if the PXP finds a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. If no PS image is present or if the PS image also matches its colorkey range, the PS background color is used. Colorkey operations are higher priority than alpha or ROP operations.

EXAMPLE

```
// colorkey values between
REG_AS_CLRKEYLOW_WR (0x000000); // black and
REG_AS_CLRKEYHIGH_WR(0x800000); // medium red
```

Address: 21C_C000h base + 2F0h offset = 21C_C2F0h

PXP_HW_PXP_AS_CLRKEYLOW_1 field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of RGB color key applied to AS buffer. Each overlay has an independent colorkey enable.

42.11.49 Overlay Color Key High (PXP_HW_PXP_AS_CLRKEYHIGH_1)

This register contains the color key high value for the AS buffer. This value is used by the Alpha B block.

When processing an image, the if the PXP finds a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. If no PS image is present or if the PS image also matches its colorkey range, the PS background color is used. Colorkey operations are higher priority than alpha or ROP operations.

EXAMPLE

```
// colorkey values between
REG_AS_CLRKEYLOW_WR (0x000000); // black and
REG_AS_CLRKEYHIGH_WR(0x800000); // medium red
```

PXP Memory Map/Register Definition

Address: 21C_C000h base + 300h offset = 21C_C300h

PXP_HW_PXP_AS_CLRKEYHIGH_1 field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of RGB color key applied to AS buffer. Each overlay has an independent colorkey enable.

42.11.50 Control Register 2 (PXP_HW_PXP_CTRL2)

The CTRL register contains controls for the secondary processing flow in PXP module.

HW_PXP_CTRL2: 0x310

HW_PXP_CTRL2_SET: 0x314

HW_PXP_CTRL2_CLR: 0x318

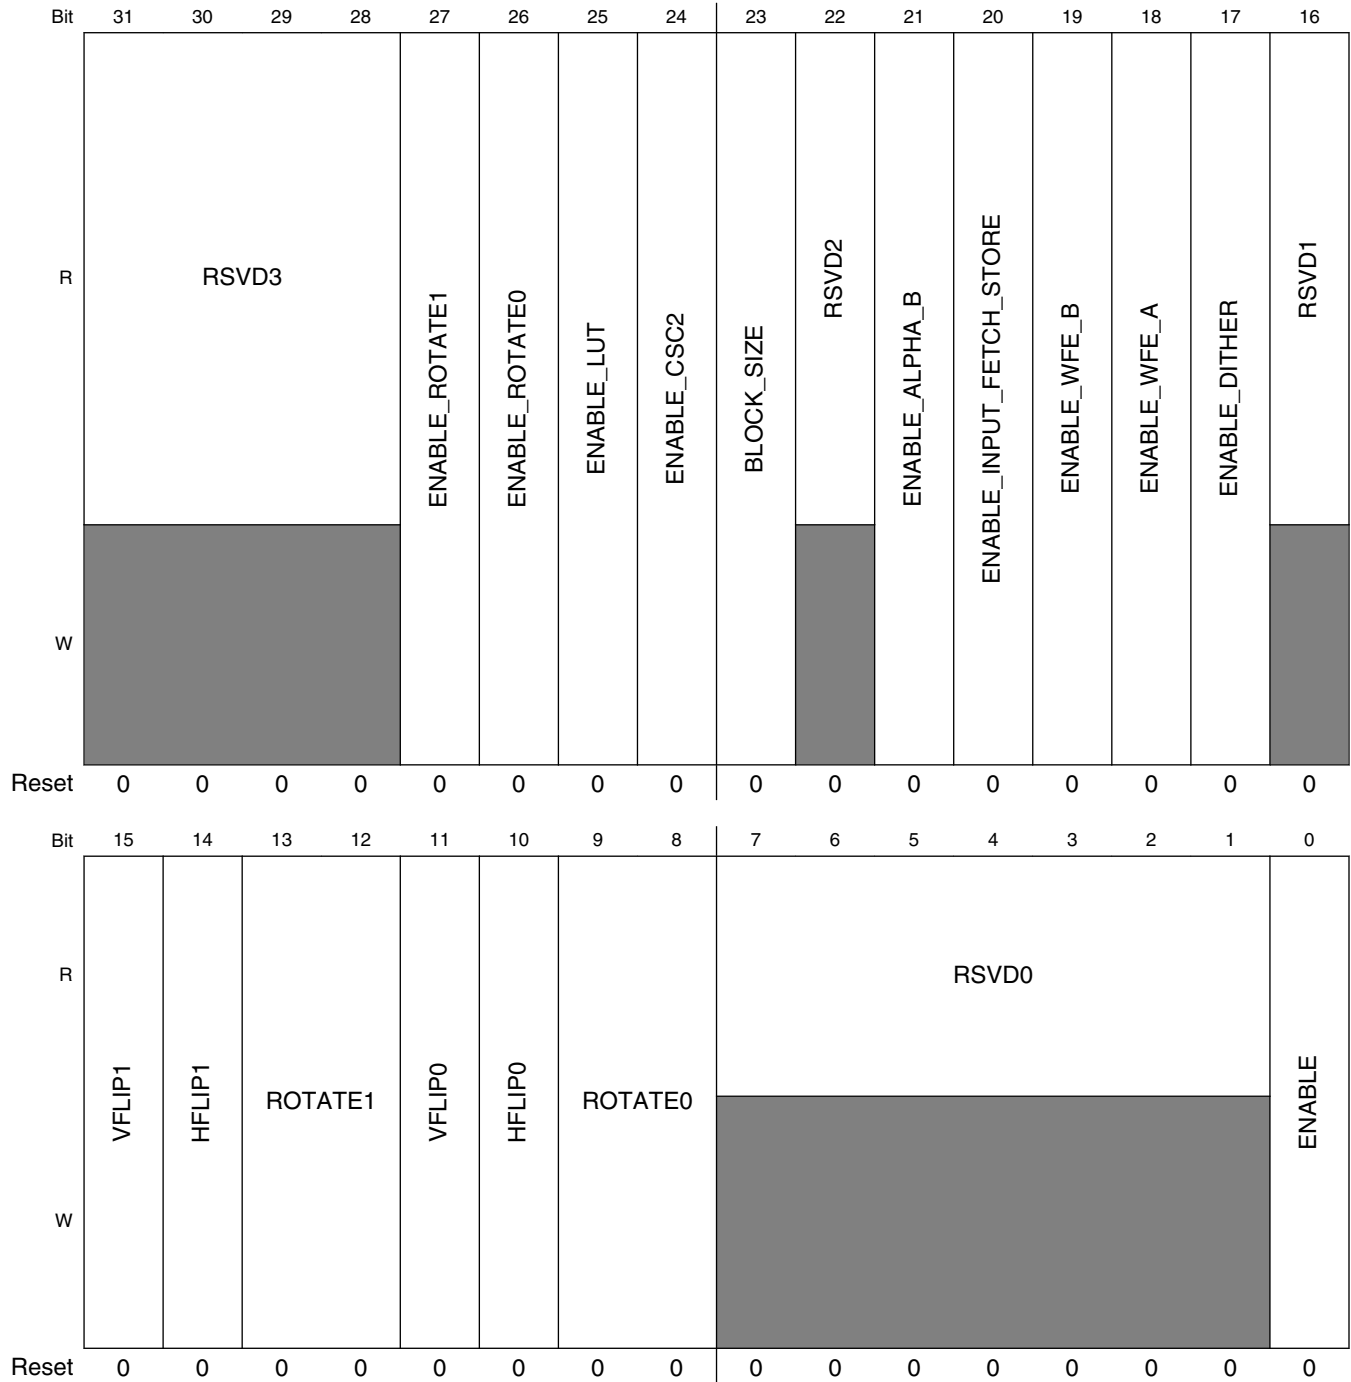

HW_PXP_CTRL2_TOG: 0x31C

The Control register contains the controls for the secondary data flow in PXP block.

EXAMPLE

```
REG_CTRL_SET(BM_PXP_CTRL_SFTRST);
REG_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 21C_C000h base + 310h offset = 21C_C310h

PXP_HW_PXP_CTRL2 field descriptions

Field	Description
31–28 RSVD3	Reserved, always set to zero.
27 ENABLE_ROTATE1	Enable the ROTATE1 engine in the PXP secondary processing flow.

Table continues on the next page...

PXP_HW_PXP_CTRL2 field descriptions (continued)

Field	Description
26 ENABLE_ROTATE0	Enable the ROTATE0 engine in the PXP secondary processing flow.
25 ENABLE_LUT	Enable the LUT engine in the PXP secondary processing flow.
24 ENABLE_CSC2	Enable the CSC2 engine in the PXP secondary processing flow.
23 BLOCK_SIZE	Select the block size to process through the Rotate block. 0x0 8X8 — Process 8x8 pixel blocks. 0x1 16X16 — Process 16x16 pixel blocks.
22 RSVD2	Reserved, always set to zero.
21 ENABLE_ALPHA_B	Enable the Alpha-B engine in the PXP secondary processing flow.
20 ENABLE_INPUT_FETCH_STORE	Enable the Input Fetch and Store engine in the PXP secondary processing flow.
19 ENABLE_WFE_B	Enable the WFE-B engine in the PXP secondary processing flow.
18 ENABLE_WFE_A	Enable the WFE-A engine in the PXP secondary processing flow.
17 ENABLE_DITHER	Enable the Dithering engine in the PXP secondary processing flow.
16 RSVD1	Reserved, always set to zero.
15 VFLIP1	Indicates that the input should be flipped vertically (effect applied before rotation).
14 HFLIP1	Indicates that the input should be flipped horizontally (effect applied before rotation).
13–12 ROTATE1	Indicates the clockwise rotation to be applied at the input buffer. The rotation effect is defined as occurring after the FLIP_X and FLIP_Y permutation. 0x0 ROT_0 — 0x1 ROT_90 — 0x2 ROT_180 — 0x3 ROT_270 —
11 VFLIP0	Indicates that the output buffer should be flipped vertically (effect applied before rotation).
10 HFLIP0	Indicates that the output buffer should be flipped horizontally (effect applied before rotation).
9–8 ROTATE0	Indicates the clockwise rotation to be applied at the output buffer. The rotation effect is defined as occurring after the FLIP_X and FLIP_Y permutation. 0x0 ROT_0 —

Table continues on the next page...

PXP_HW_PXP_CTRL2 field descriptions (continued)

Field	Description
	0x1 ROT_90 — 0x2 ROT_180 — 0x3 ROT_270 —
7–1 RSVD0	Reserved, always set to zero.
0 ENABLE	Enables PXP secondary data processing flow with specified parameters. The ENABLE bit will remain set while the PXP is active and will be cleared once the current operation completes. Software should use the IRQ bit in the HW_PXP_STAT when polling for PXP completion.

42.11.51 PXP Power Control Register. (PXP_HW_PXP_POWER_REG0)

This register controls power states for PXP memories.

Address: 21C_C000h base + 320h offset = 21C_C320h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	CTRL																ROT0_	LUT_LP_	LUT_LP_	LUT_LP_												
W																	MEM_	STATE_	STATE_	STATE_												
																	LP_	WAY1_	WAY0_	WAY0_												
																	STATE	BANKN	BANKN	BANK0												
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_POWER_REG0 field descriptions

Field	Description
31–12 CTRL	This register contains power control for the PXP.
11–9 ROT0_MEM_LP_ STATE	Select the low power state of the ROT 0 memory. 0x0 NONE — Memory is not in low power state. 0x1 LS — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 DS — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 SD — Shut Down Mode. Shut Down periphery and core, no memory retention.
8–6 LUT_LP_ STATE_WAY1_ BANKN	Select the low power state of the LUT's WAY0-BANK0,1,2,3 memory. 0x0 NONE — Memory is not in low power state. 0x1 LS — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 DS — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 SD — Shut Down Mode. Shut Down periphery and core, no memory retention.
5–3 LUT_LP_ STATE_WAY0_ BANKN	Select the low power state of the LUT's WAY0-BANK1,2,3 memory. 0x0 NONE — Memory is not in low power state. 0x1 LS — Light Sleep Mode. Low leakage mode, maintain memory contents.

Table continues on the next page...

PXP_HW_PXP_POWER_REG0 field descriptions (continued)

Field	Description
	0x2 DS — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 SD — Shut Down Mode. Shut Down periphery and core, no memory retention.
LUT_LP_STATE_WAY0_BANK0	Select the low power state of the LUT's WAY0-BANK0 memory. 0x0 NONE — Memory is not in low power state. 0x1 LS — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 DS — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 SD — Shut Down Mode. Shut Down periphery and core, no memory retention.

42.11.52 PXP Power Control Register 1. (PXP_HW_PXP_POWER_REG1)

This register controls power states for PXP memories.

Address: 21C_C000h base + 330h offset = 21C_C330h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD0								ALU_B_MEM_LP_STATE	ALU_A_MEM_LP_STATE			DITH2_LUT_MEM_LP_STATE			
W	RSVD0								ALU_B_MEM_LP_STATE	ALU_A_MEM_LP_STATE			DITH2_LUT_MEM_LP_STATE			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DITH2_LUT_MEM_LP_STATE	DITH1_LUT_MEM_LP_STATE			DITH0_ERR1_MEM_LP_STATE			DITH0_ERR0_MEM_LP_STATE			DITH0_LUT_MEM_LP_STATE			ROT1_MEM_LP_STATE		
W	DITH2_LUT_MEM_LP_STATE	DITH1_LUT_MEM_LP_STATE			DITH0_ERR1_MEM_LP_STATE			DITH0_ERR0_MEM_LP_STATE			DITH0_LUT_MEM_LP_STATE			ROT1_MEM_LP_STATE		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_POWER_REG1 field descriptions

Field	Description
31–24 RSVD0	This register contains power control for the PXP.
23–21 ALU_B_MEM_LP_STATE	Select the low power state of the ALU B memory. 0x0 NONE — Memory is not in low power state. 0x1 LS — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 DS — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 SD — Shut Down Mode. Shut Down periphery and core, no memory retention.

Table continues on the next page...

PXP_HW_PXP_POWER_REG1 field descriptions (continued)

Field	Description
20–18 ALU_A_MEM_LP_STATE	Select the low power state of the ALU A memory. 0x0 NONE — Memory is not in low power state. 0x1 LS — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 DS — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 SD — Shut Down Mode. Shut Down periphery and core, no memory retention.
17–15 DITH2_LUT_MEM_LP_STATE	Select the low power state of the dither2 LUT memory. 0x0 NONE — Memory is not in low power state. 0x1 LS — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 DS — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 SD — Shut Down Mode. Shut Down periphery and core, no memory retention.
14–12 DITH1_LUT_MEM_LP_STATE	Select the low power state of the dither1 LUT memory. 0x0 NONE — Memory is not in low power state. 0x1 LS — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 DS — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 SD — Shut Down Mode. Shut Down periphery and core, no memory retention.
11–9 DITH0_ERR1_MEM_LP_STATE	Select the low power state of the dither0 ERR1 memory. 0x0 NONE — Memory is not in low power state. 0x1 LS — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 DS — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 SD — Shut Down Mode. Shut Down periphery and core, no memory retention.
8–6 DITH0_ERR0_MEM_LP_STATE	Select the low power state of the dither0 ERR0 memory. 0x0 NONE — Memory is not in low power state. 0x1 LS — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 DS — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 SD — Shut Down Mode. Shut Down periphery and core, no memory retention.
5–3 DITH0_LUT_MEM_LP_STATE	Select the low power state of the dither0 LUT memory. 0x0 NONE — Memory is not in low power state. 0x1 LS — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 DS — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 SD — Shut Down Mode. Shut Down periphery and core, no memory retention.
ROT1_MEM_LP_STATE	Select the low power state of the ROT 1 memory. 0x0 NONE — Memory is not in low power state. 0x1 LS — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 DS — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 SD — Shut Down Mode. Shut Down periphery and core, no memory retention.

42.11.53 PXP_HW_PXP_DATA_PATH_CTRL1

This register helps decide the data path gthrough the PXP.

PXP Memory Map/Register Definition

HW_PXP_DATA_PATH_CTRL1: 0x350

HW_PXP_DATA_PATH_CTRL1_SET: 0x354

HW_PXP_DATA_PATH_CTRL1_CLR: 0x358

HW_PXP_DATA_PATH_CTRL1_TOG: 0x35C

The Control register contains the control bits for the data path through the PXP.

EXAMPLE

Address: 21C_C000h base + 350h offset = 21C_C350h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	RSVD0																
W	[Shaded]																
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	RSVD0												MUX17_SEL		MUX16_SEL		
W	[Shaded]												[Shaded]		[Shaded]		
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

PXP_HW_PXP_DATA_PATH_CTRL1 field descriptions

Field	Description
31–4 RSVD0	Reserved. This field always reads 0.
3–2 MUX17_SEL	This field chooses the data path through MUX 17. 0x0 0 — Output of ALU A 0x1 1 — Output of ALU B 0x2 2 — No output 0x3 3 — No Output
MUX16_SEL	This mux chooses the data path through MUX 16. 0x0 0 — Output of ALU A Engine 0x1 1 — histogram_pixel output from output 0x2 2 — Output of ALU B Engine 0x3 3 — No output

42.11.54 Initialize memory buffer control Register (PXP_HW_PXP_INIT_MEM_CTRL)

Controls initializing/writing to dither and ALU memory buffers.

HW_PXP_INIT_MEM_CTRL: 0x360

HW_PXP_INIT_MEM_CTRL_SET: 0x364

HW_PXP_INIT_MEM_CTRL_CLR: 0x368

HW_PXP_INIT_MEM_CTRL_TOG: 0x36C

This register controls IRQ the intializing of internal pxp rams.

EXAMPLE

Address: 21C_C000h base + 360h offset = 21C_C360h

PXP_HW_PXP_INIT_MEM_CTRL field descriptions

Field	Description
31 START	Enable writing to the memory.
30–27 SELECT	Select which memory to write. 0x0 DITHER0_LUT — Select the LUT memory for access 0x1 DITHER0_ERR0 — Select the ERR0 memory for access 0x2 DITHER0_ERR1 — Select the ERR1 memory for access 0x3 DITHER1_LUT — Select the LUT memory for access 0x4 DITHER2_LUT — Select the LUT memory for access 0x5 ALU_A — Select the ALU instr memory for access 0x6 ALU_B — Select the ALU instr memory for access 0x7 WFE_A_FETCH — Select the WFE-A fetch memory for access 0x8 WFE_B_FETCH — Select the WFE-B fetch memory for access

Table continues on the next page...

PXP_HW_PXP_INIT_MEM_CTRL field descriptions (continued)

Field	Description
26–16 RSVD0	Reserved.
ADDR	Base address to start writing. The control logic will increment the address value internally each time the data register is written.

42.11.55 Write data Register (PXP_HW_PXP_INIT_MEM_DATA)

Write data for initializing/writing to dither, ALU and fetch memory buffers.

This register holds the data word to initialize internal pxp rams.

EXAMPLE

Address: 21C_C000h base + 370h offset = 21C_C370h

PXP_HW_PXP_INIT_MEM_DATA field descriptions

Field	Description
DATA	Data value to be written to the memory. A write to this register kicks off a write cycle to the memory selected.

42.11.56 Write data Register (PXP_HW_PXP_INIT_MEM_DATA_HIGH)

Write data for initializing/writing to the most significant 32 bits of the fetch memory buffers.

This register holds the upper data word to initialize internal pxp fetch rams.

EXAMPLE

Address: 21C_C000h base + 380h offset = 21C_C380h

PXP_HW_PXP_INIT_MEM_DATA_HIGH field descriptions

Field	Description
DATA	Data value to be written to the most significant 32 bits of the fetch memories. this register must be written before the HW_PXP_INIT_MEM_DATA as that register triggers the write cycle to memory.

42.11.57 PXP IRQ Mask Register (PXP_HW_PXP_IRQ_MASK)

Controls masking for all PXP interrupts

HW_PXP_IRQ_MASK: 0x390

HW_PXP_IRQ_MASK_SET: 0x394

HW_PXP_IRQ_MASK_CLR: 0x398

HW_PXP_IRQ_MASK_TOG: 0x39C

This register controls IRQ masks for all PXP interrupts

EXAMPLE

Address: 21C_C000h base + 390h offset = 21C_C390h

PXP Memory Map/Register Definition

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	WFE_B_STORE_IRQ_EN	WFE_A_STORE_IRQ_EN	DITHER_STORE_IRQ_EN	FIRST_STORE_IRQ_EN	WFE_B_CH1_STORE_IRQ_EN	WFE_B_CH0_STORE_IRQ_EN	WFE_A_CH1_STORE_IRQ_EN	WFE_A_CH0_STORE_IRQ_EN	DITHER_CH1_STORE_IRQ_EN	DITHER_CH0_STORE_IRQ_EN	DITHER_CH1_PREFETCH_IRQ_EN	DITHER_CH0_PREFETCH_IRQ_EN	FIRST_CH1_STORE_IRQ_EN	FIRST_CH0_STORE_IRQ_EN	FIRST_CH1_PREFETCH_IRQ_EN	FIRST_CH0_PREFETCH_IRQ_EN

PXP_HW_PXP_IRQ_MASK field descriptions

Field	Description
31 COMPRESS_ DONE_IRQ_EN	Enable compression done interrupt detection.
30–16 RSVD1	Reserved.
15 WFE_B_ STORE_IRQ_EN	Enable WFE B store engine interrupt detection.
14 WFE_A_ STORE_IRQ_EN	Enable WFE A store engine interrupt detection.
13 DITHER_ STORE_IRQ_EN	Enable dither store engine interrupt detection.
12 FIRST_STORE_ IRQ_EN	Enable First store engine interrupt detection
11 WFE_B_CH1_ STORE_IRQ_EN	Enable WFE B ch1 store engine interrupt detection.
10 WFE_B_CH0_ STORE_IRQ_EN	Enable WFE B ch0 store engine interrupt detection.
9 WFE_A_CH1_ STORE_IRQ_EN	Enable WFE A ch1 store engine interrupt detection.
8 WFE_A_CH0_ STORE_IRQ_EN	Enable WFE A ch0 store engine interrupt detection.

Table continues on the next page...

PXP_HW_PXP_IRQ_MASK field descriptions (continued)

Field	Description
7 DITHER_CH1_ STORE_IRQ_EN	Enable dither ch1 store engine interrupt detection.
6 DITHER_CH0_ STORE_IRQ_EN	Enable dither ch0 store engine interrupt detection.
5 DITHER_CH1_ PREFETCH_ IRQ_EN	Enable Dither ch1 prefetch engine interrupt detection
4 DITHER_CH0_ PREFETCH_ IRQ_EN	Enable Dither ch0 prefetch engine interrupt detection
3 FIRST_CH1_ STORE_IRQ_EN	Enable First ch1 store engine interrupt detection
2 FIRST_CH0_ STORE_IRQ_EN	Enable First ch0 store engine interrupt detection
1 FIRST_CH1_ PREFETCH_ IRQ_EN	Enable First ch1 prefetch engine interrupt detection
0 FIRST_CH0_ PREFETCH_ IRQ_EN	Enable First ch0 prefetch engine interrupt detection

42.11.58 PXP Interrupt Register (PXP_HW_PXP_IRQ)

PXP Fetch and Store engine IRQs. Each interrupt has a corresponding mask register in HW_EPDC_IRQ_MASK

HW_PXP_IRQ: 0x3A0

HW_PXP_IRQ_SET: 0x3A4

HW_PXP_IRQ_CLR: 0x3a8

HW_PXP_IRQ_TOG: 0x3AC

This register houses the interrupt bits for the Prefetch and Store Engines

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + 3A0h offset = 21C_C3A0h

PXP_HW_PXP_IRQ field descriptions

Field	Description
31 COMPRESS_ DONE_IRQ	compression done Interrupt
30–16 RSVD1	Reserved.
15 WFE_B_ STORE_IRQ	WFE B store engine Interrupt
14 WFE_A_ STORE_IRQ	WFE A store engine Interrupt.

Table continues on the next page...

PXP_HW_PXP_IRQ field descriptions (continued)

Field	Description
13 DITHER_ STORE_IRQ	Dither store engine Interrupt
12 FIRST_STORE_ IRQ	Initial store engine interrupt
11 WFE_B_CH1_ STORE_IRQ	WFE B ch1 store engine Interrupt
10 WFE_B_CH0_ STORE_IRQ	WFE B ch0 store engine Interrupt
9 WFE_A_CH1_ STORE_IRQ	WFE A ch1 store engine Interrupt.
8 WFE_A_CH0_ STORE_IRQ	WFE A ch0 store engine Interrupt.
7 DITHER_CH1_ STORE_IRQ	Dither ch1 store engine Interrupt
6 DITHER_CH0_ STORE_IRQ	Dither ch0 store engine Interrupt
5 DITHER_CH1_ PREFETCH_IRQ	Dither ch1 prefetch engine interrupt
4 DITHER_CH0_ PREFETCH_IRQ	Dither ch0 prefetch engine interrupt
3 FIRST_CH1_ STORE_IRQ	Initial ch1 store engine interrupt
2 FIRST_CH0_ STORE_IRQ	Initial ch0 store engine interrupt
1 FIRST_CH1_ PREFETCH_IRQ	Initial ch1 prefetch engine interrupt
0 FIRST_CH0_ PREFETCH_IRQ	Initial ch0 prefetch engine interrupt

42.11.59 Next Frame Pointer (PXP_HW_PXP_NEXT)

This register contains a pointer to a data structure used to reload the PXP registers at the end of the current frame.

PXP Memory Map/Register Definition

To enable this functionality, software must write this register while the PXP is processing the current data frame (if the PXP is currently idle, this will also initiate an immediate load of registers from the pointer). The process of writing this register (WRITE operation) will set a semaphore in hardware to notify the control logic that a register reload operation must be performed when the current frame processing is complete. At the end of a frame, the PXP will fetch the register settings from this location, signal an interrupt to software, then proceed with rendering the next frame of data. Software may cancel the reload operation by issuing a CLEAR operation to this register. SET and TOGGLE operations should not be used when addressing this register. All registers will be reloaded with the exception of the following: STAT, CSCCOEFn, NEXT, VERSION. All other registers will be loaded in the order they appear in the register map. Once the pointer's contents have been loaded into the PXP's registers, the NEXT_IRQ interrupt will be issued (see the PXP_STATUS register).

EXAMPLE

```
// create register command structure in memory
u32* pxp_commands0[48], pxp_commands1;
u32 rc;

// initialize control structure for frame 0
pxp_commands0[0] = ...; // CTRL
pxp_commands0[1] = ...; // OUT Buffer
...
pxp_commands0[47] = ..; // Overlay7 param2

// initialize control structure for frame 1
pxp_commands1[0] = ...; // CTRL
pxp_commands1[1] = ...; // OUT Buffer
...
pxp_commands1[47] = ..; // Overlay7 param2

// poll until a command isn't queued
while (rc=REG_NEXT_RD() & BM_PXP_NEXT_ENABLED );
REG_NEXT_WR(pxp_commands0); // enable PXP operation 0 via command pointer

// poll until first command clears
while (rc=REG_NEXT_RD() & BM_PXP_NEXT_ENABLED );
REG_NEXT_WR(pxp_commands1); // enable PXP operation 1 via command pointer
```

Address: 21C_C000h base + 400h offset = 21C_C400h

PXP_HW_PXP_NEXT field descriptions

Field	Description
31–2 POINTER	A pointer to a data structure containing register values to be used when processing the next frame. The pointer must be 32-bit aligned and should reside in on-chip or off-chip memory.
1 RSVD	Reserved, always set to zero.
0 ENABLED	Indicates that the "next frame" functionality has been enabled. This bit reflects the status of the hardware semaphore indicating that a reload operation is pending at the end of the current frame.

42.11.60 Pre-fetch engine Control Channel 0 Register (PXP_HW_PXP_INPUT_FETCH_CTRL_CH0)

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_INPUT_FETCH_CTRL_CH0: 0x450

HW_PXP_INPUT_FETCH_CTRL_CH0_SET: 0x454

HW_PXP_INPUT_FETCH_CTRL_CH0_CLR: 0x458

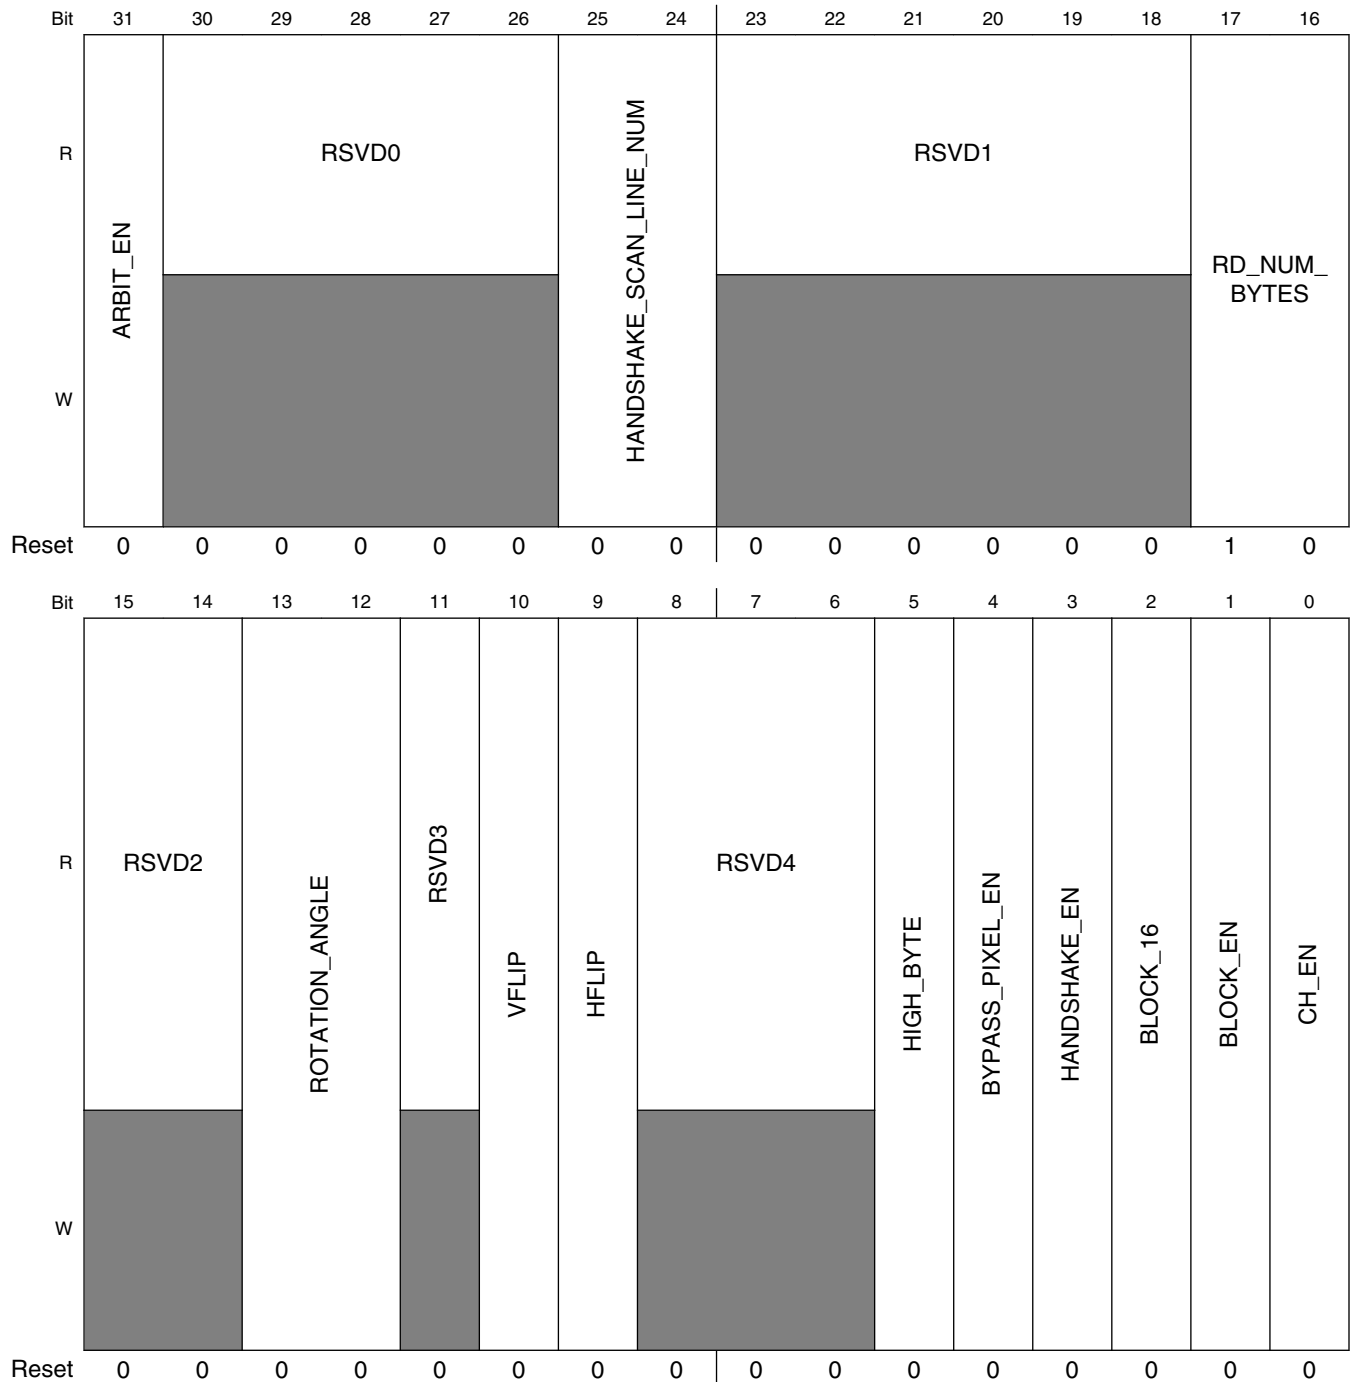

HW_PXP_INPUT_FETCH_CTRL_CH0_TOG: 0x45C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + 450h offset = 21C_C450h

PXP_HW_PXP_INPUT_FETCH_CTRL_CH0 field descriptions

Field	Description
31 ARBIT_EN	<p>Enables Arbitration</p> <p>0x0 0 — Arbitration disable. If using 2 channels, will output 2 axi bus sets.</p> <p>0x1 1 — Arbitration enable. If using 2 channel, will only output 1 axi bus sets</p>

Table continues on the next page...

PXP_HW_PXP_INPUT_FETCH_CTRL_CH0 field descriptions (continued)

Field	Description
30–26 RSVD0	Reserved, always set to zero.
25–24 HANDSHAKE_ SCAN_LINE_ NUM	scan handshake line number 0x0 0 — 1 line. 0x1 1 — 8 lines 0x2 2 — 16 lines 0x3 3 — 16 lines
23–18 RSVD1	Reserved, always set to zero.
17–16 RD_NUM_ BYTES	Bytes in a read burst 0x0 8_bytes — 8 bytes. 0x1 16_bytes — 16 bytes. 0x2 32_bytes — 32 bytes. 0x3 64_bytes — 64 bytes.
15–14 RSVD2	Reserved, always set to zero.
13–12 ROTATION_ ANGLE	0x0 ROT_0 — Rotate image by 0 degrees. 0x1 ROT_90 — Rotate image by 90 degrees. 0x2 ROT_180 — Rotate image by 180 degrees. 0x3 ROT_270 — Rotate image by 270 degrees.
11 RSVD3	Reserved, always set to zero.
10 VFLIP	Enables VFLIP 0x0 0 — VFLIP disable 0x1 1 — VFLIP enable
9 HFLIP	Enables HFLIP. 0x0 0 — HFLIP disable 0x1 1 — VFLIP enable
8–6 RSVD4	Reserved, always set to zero.
5 HIGH_BYTE	channel 0 high byte selection 0x0 0 — In 64 bit mode, the output high byte will use channel1. 0x1 1 — In 64 bit mode, the output high byte will use channel0
4 BYPASS_ PIXEL_EN	Selects Channel 0 pixel source 0x0 0 — Channel 0 is from memory 0x1 1 — Channel 0 is from previous process engine
3 HANDSHAKE_ EN	Enable bit for handshake with the store engine. 0x0 0 — Handshake with the store engine is disabled 0x1 1 — Handshake with the store engine is enabled
2 BLOCK_16	Determines the block size.

Table continues on the next page...

PXP_HW_PXP_INPUT_FETCH_CTRL_CH0 field descriptions (continued)

Field	Description
	0x0 8x8 — Block size is 8x8 0x1 16x16 — Block size is 16x16
1 BLOCK_EN	Chooses the prefetch mode. 0x0 0 — Prefetch in scan mode 0x1 1 — Prefetch in block mode
0 CH_EN	Channel enable. 0x0 0 — Prefetch function is disable 0x1 1 — Prefetch function is enable

42.11.61 Pre-fetch engine Control Channel 1 Register (PXP_HW_PXP_INPUT_FETCH_CTRL_CH1)

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_INPUT_FETCH_CTRL_CH1: 0x460

HW_PXP_INPUT_FETCH_CTRL_CH1_SET: 0x464

HW_PXP_INPUT_FETCH_CTRL_CH1_CLR: 0x468

HW_PXP_INPUT_FETCH_CTRL_CH1_TOG: 0x46C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 460h offset = 21C_C460h

PXP_HW_PXP_INPUT_FETCH_CTRL_CH1 field descriptions

Field	Description
31–26 RSVD0	Reserved, always set to zero.
25–24 HANDSHAKE_SCAN_LINE_NUM	scan handshake line number 0x0 0 — 1 line. 0x1 1 — 8 lines 0x2 2 — 16 lines 0x3 3 — 16 lines
23–18 RSVD1	Reserved, always set to zero.
17–16 RD_NUM_BYTES	Bytes in a read burst 0x0 8_bytes — 8 bytes. 0x1 16_bytes — 16 bytes. 0x2 32_bytes — 32 bytes. 0x3 64_bytes — 64 bytes.
15–14 RSVD2	Reserved, always set to zero.
13–12 ROTATION_ANGLE	0x0 ROT_0 — Rotate image by 0 degrees. 0x1 ROT_90 — Rotate image by 90 degrees. 0x2 ROT_180 — Rotate image by 180 degrees. 0x3 ROT_270 — Rotate image by 270 degrees.

Table continues on the next page...

PXP_HW_PXP_INPUT_FETCH_CTRL_CH1 field descriptions (continued)

Field	Description
11 RSVD3	Reserved, always set to zero.
10 VFLIP	Enables VFLIP 0x0 0 — VFLIP disable 0x1 1 — VFLIP enable
9 HFLIP	Enables HFLIP. 0x0 0 — HFLIP disable 0x1 1 — VFLIP enable
8–5 RSVD4	Reserved, always set to zero.
4 BYPASS_ PIXEL_EN	Selects Channel 1 pixel source 0x0 0 — Channel 1 is from memory 0x1 1 — Channel 1 is from previous process engine
3 HANDSHAKE_ EN	Enable bit for handshake with the store engine. 0x0 0 — Handshake with the store engine is disabled 0x1 1 — Handshake with the store engine is enabled
2 BLOCK_16	Determines the block size. 0x0 8x8 — Block size is 8x8 0x1 16x16 — Block size is 16x16
1 BLOCK_EN	Chooses the prefetch mode. 0x0 0 — Prefetch in scan mode 0x1 1 — Prefetch in block mode
0 CH_EN	Channel enable. 0x0 0 — prefetch function is disable 0x1 1 — prefetch function is enable

42.11.62 Pre-fetch engine status Channel 0 Register (PXP_HW_PXP_INPUT_FETCH_STATUS_CH0)

This register defines the status bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 470h offset = 21C_C470h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	PREFETCH_BLOCK_Y																PREFETCH_BLOCK_X																
W	[Shaded]																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_INPUT_FETCH_STATUS_CH0 field descriptions

Field	Description
31–16 PREFETCH_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.
PREFETCH_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

42.11.63 Store engine status Channel 1 Register (PXP_HW_PXP_INPUT_FETCH_STATUS_CH1)

This register defines the status bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 480h offset = 21C_C480h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	PREFETCH_BLOCK_Y																PREFETCH_BLOCK_X																
W	[Shaded]																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_INPUT_FETCH_STATUS_CH1 field descriptions

Field	Description
31–16 PREFETCH_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.
PREFETCH_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

42.11.64 PXP_HW_PXP_INPUT_FETCH_ACTIVE_SIZE_ULC_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 490h offset = 21C_C490h

PXP_HW_PXP_INPUT_FETCH_ACTIVE_SIZE_ULC_CH0 field descriptions

Field	Description
31–16 ACTIVE_SIZE_ULC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_ULC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

42.11.65 PXP_HW_PXP_INPUT_FETCH_ACTIVE_SIZE_LRC_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 4A0h offset = 21C_C4A0h

PXP_HW_PXP_INPUT_FETCH_ACTIVE_SIZE_LRC_CH0 field descriptions

Field	Description
31–16 ACTIVE_SIZE_LRC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_LRC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

42.11.66 PXP_HW_PXP_INPUT_FETCH_ACTIVE_SIZE_ULC_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 4B0h offset = 21C_C4B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_INPUT_FETCH_ACTIVE_SIZE_ULC_CH1 field descriptions

Field	Description
31–16 ACTIVE_SIZE_ULC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_ULC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

42.11.67 PXP_HW_PXP_INPUT_FETCH_ACTIVE_SIZE_LRC_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 4C0h offset = 21C_C4C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_INPUT_FETCH_ACTIVE_SIZE_LRC_CH1 field descriptions

Field	Description
31–16 ACTIVE_SIZE_LRC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_LRC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

42.11.68 PXP_HW_PXP_INPUT_FETCH_SIZE_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 4D0h offset = 21C_C4D0h

PXP_HW_PXP_INPUT_FETCH_SIZE_CH0 field descriptions

Field	Description
31-16 INPUT_TOTAL_HEIGHT	actual total height - 1
INPUT_TOTAL_WIDTH	actual total width -1

42.11.69 PXP_HW_PXP_INPUT_FETCH_SIZE_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 4E0h offset = 21C_C4E0h

PXP_HW_PXP_INPUT_FETCH_SIZE_CH1 field descriptions

Field	Description
31-16 INPUT_TOTAL_HEIGHT	actual total height -1
INPUT_TOTAL_WIDTH	actual total width -1

42.11.70 PXP_HW_PXP_INPUT_FETCH_BACKGROUND_COLOR_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 4F0h offset = 21C_C4F0h

**PXP_HW_PXP_INPUT_FETCH_BACKGROUND_COLOR_CH0 field descriptions**

Field	Description
BACKGROUND_COLOR	background color(in 32bpp format) for any pixels not within the buffer range specified by the ULC/LRC

42.11.71 PXP_HW_PXP_INPUT_FETCH_BACKGROUND_COLOR_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 500h offset = 21C_C500h

**PXP_HW_PXP_INPUT_FETCH_BACKGROUND_COLOR_CH1 field descriptions**

Field	Description
BACKGROUND_COLOR	background color(in 32bpp format) for any pixels not within the buffer range specified by the ULC/LRC

42.11.72 PXP_HW_PXP_INPUT_FETCH_PITCH

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + 510h offset = 21C_C510h

PXP_HW_PXP_INPUT_FETCH_PITCH field descriptions

Field	Description
31–16 CH1_INPUT_PITCH	This field indicates the channel 1 input pitch
CH0_INPUT_PITCH	This field indicates the channel 0 input pitch

42.11.73 PXP_HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH0: 0x520

HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH0_SET: 0x524

HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH0_CLR: 0x528

HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH0_TOG: 0x52C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 520h offset = 21C_C520h

PXP_HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH0 field descriptions

Field	Description
31–13 RSVD0	Reserved, always set to zero.
12 SHIFT_BYPASS	0x0 0 — channel0 data will do shift function 0x1 1 — channel0 will bypass shift function
11 EXPAND_EN	0x0 0 — channel0 format expanding disable 0x1 1 — channel0 format expanding enable
10–8 EXPAND_FORMAT	Select Pixel format 0x0 0 — RGB 565 0x1 1 — RGB 555 0x2 2 — ARGB 1555 0x3 3 — RGB 444 0x4 4 — ARGB 4444 0x5 5 — YUYV/YVYU 0x6 6 — UYVY/VYUY 0x7 7 — YUV422_2P
7–2 RSVD1	Reserved, always set to zero.
INPUT_ACTIVE_BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits

42.11.74 PXP_HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH1: 0x530

HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH1_SET: 0x534

HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH1_CLR: 0x538

PXP Memory Map/Register Definition

HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH1_TOG: 0x53C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 530h offset = 21C_C530h

PXP_HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH1 field descriptions

Field	Description
31–13 RSVD0	Reserved, always set to zero.
12 SHIFT_BYPASS	0x0 0 — channel1 data will do shift function 0x1 1 — channel1 will bypass shift function
11 EXPAND_EN	0x0 0 — channel1 format expanding disable 0x1 1 — channel1 format expanding enable
10–8 EXPAND_FORMAT	Select Pixel format 0x0 0 — RGB 565 0x1 1 — RGB 555 0x2 2 — ARGB 1555 0x3 3 — RGB 444 0x4 4 — ARGB 4444

Table continues on the next page...

PXP_HW_PXP_INPUT_FETCH_SHIFT_CTRL_CH1 field descriptions (continued)

Field	Description
	0x5 5 — YUYV/YVYU 0x6 6 — UYVY/VYUY 0x7 7 — YUV422_2P
7–2 RSVD1	Reserved, always set to zero.
INPUT_ACTIVE_ BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits

42.11.75 PXP_HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH0: 0x540

HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH0_SET: 0x544

HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH0_CLR: 0x548

HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH0_TOG: 0x54C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 540h offset = 21C_C540h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
R	RSVD0			OFFSET3						RSVD1			OFFSET2						RSVD2			OFFSET1						RSVD3			OFFSET0					
W	0			0						0			0						0			0						0			0					
Reset	0			0						0			0						0			0						0			0					

PXP_HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH0 field descriptions

Field	Description
31–29 RSVD0	Reserved, always set to zero.
28–24 OFFSET3	Shift Offset for channel 0 component 3.
23–21 RSVD1	Reserved, always set to zero.
20–16 OFFSET2	Shift Offset for channel 0 component 2.

Table continues on the next page...

PXP_HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH0 field descriptions (continued)

Field	Description
15–13 RSVD2	Reserved, always set to zero.
12–8 OFFSET1	Shift Offset for channel 0 component 1.
7–5 RSVD3	Reserved, always set to zero.
OFFSET0	Shift Offset for channel 0 component 0.

42.11.76 PXP_HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH1: 0x550

HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH1_SET: 0x554

HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH1_CLR: 0x558

HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH1_TOG: 0x55C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 550h offset = 21C_C550h

PXP_HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH1 field descriptions

Field	Description
31–29 RSVD0	Reserved, always set to zero.
28–24 OFFSET3	Shift Offset for channel 1 component 3.
23–21 RSVD1	Reserved, always set to zero.
20–16 OFFSET2	Shift Offset for channel 1 component 2.
15–13 RSVD2	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_INPUT_FETCH_SHIFT_OFFSET_CH1 field descriptions (continued)

Field	Description
12–8 OFFSET1	Shift Offset for channel 1 component 1.
7–5 RSVD3	Reserved, always set to zero.
OFFSET0	Shift Offset for channel 1 component 0.

42.11.77 PXP_HW_PXP_INPUT_FETCH_SHIFT_WIDTH_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_INPUT_FETCH_SHIFT_WIDTH_CH0: 0x560

HW_PXP_INPUT_FETCH_SHIFT_WIDTH_CH0_SET: 0x564

HW_PXP_INPUT_FETCH_SHIFT_WIDTH_CH0_CLR: 0x568

HW_PXP_INPUT_FETCH_SHIFT_WIDTH_CH0_TOG: 0x56C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 560h offset = 21C_C560h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0																WIDTH3			WIDTH2			WIDTH1			WIDTH0						
W	[Shaded]																[Shaded]			[Shaded]			[Shaded]			[Shaded]						
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	1	0	0	0	1	0	0	0

PXP_HW_PXP_INPUT_FETCH_SHIFT_WIDTH_CH0 field descriptions

Field	Description
31–16 RSVD0	Reserved, always set to zero.
15–12 WIDTH3	Shift Width for channel 0 component 3.
11–8 WIDTH2	Shift Width for channel 0 component 2.
7–4 WIDTH1	Shift Width for channel 0 component 1.
WIDTH0	Shift Width for channel 0 component 0.

42.11.78 PXP_HW_PXP_INPUT_FETCH_SHIFT_WIDTH_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_INPUT_FETCH_SHIFT_WIDTH_CH1: 0x570

HW_PXP_INPUT_FETCH_SHIFT_WIDTH_CH1_SET: 0x574

HW_PXP_INPUT_FETCH_SHIFT_WIDTH_CH1_CLR: 0x578

HW_PXP_INPUT_FETCH_SHIFT_WIDTH_CH1_TOG: 0x57C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 570h offset = 21C_C570h

PXP_HW_PXP_INPUT_FETCH_SHIFT_WIDTH_CH1 field descriptions

Field	Description
31–16 RSVD0	Reserved, always set to zero.
15–12 WIDTH3	Shift Width for channel 1 component 3.
11–8 WIDTH2	Shift Width for channel 1 component 2.
7–4 WIDTH1	Shift Width for channel 1 component 1.
WIDTH0	Shift Width for channel 1 component 0.

42.11.79 PXP_HW_PXP_INPUT_FETCH_ADDR_0_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 580h offset = 21C_C580h

PXP_HW_PXP_INPUT_FETCH_ADDR_0_CH0 field descriptions

Field	Description
INPUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

42.11.80 PXP_HW_PXP_INPUT_FETCH_ADDR_1_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 590h offset = 21C_C590h

PXP_HW_PXP_INPUT_FETCH_ADDR_1_CH0 field descriptions

Field	Description
INPUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

42.11.81 PXP_HW_PXP_INPUT_FETCH_ADDR_0_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 5A0h offset = 21C_C5A0h

PXP_HW_PXP_INPUT_FETCH_ADDR_0_CH1 field descriptions

Field	Description
INPUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

42.11.82 PXP_HW_PXP_INPUT_FETCH_ADDR_1_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 5B0h offset = 21C_C5B0h

PXP_HW_PXP_INPUT_FETCH_ADDR_1_CH1 field descriptions

Field	Description
INPUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

42.11.83 Store engine Control Channel 0 Register (PXP_HW_PXP_INPUT_STORE_CTRL_CH0)

This register defines the control bits for the pxp store_engine sub-block.

HW_PXP_INPUT_STORE_CTRL_CH0: 0x5C0

HW_PXP_INPUT_STORE_CTRL_CH0_SET: 0x5C4

HW_PXP_INPUT_STORE_CTRL_CH0_CLR: 0x5C8

HW_PXP_INPUT_STORE_CTRL_CH0_TOG: 0x5CC

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 5C0h offset = 21C_C5C0h

PXP_HW_PXP_INPUT_STORE_CTRL_CH0 field descriptions

Field	Description
31 ARBIT_EN	Arbitration Enable 0x0 0 — Arbitration disable. If using 2 channels, will output 2 axi bus sets 0x1 1 — Arbitration enable. If using 2 channel, will only output 1 axi bus sets
30–25 RSVD0	Reserved, always set to zero.
24 COMBINE_2CHANNEL	Combine 2 channel Enable

Table continues on the next page...

PXP_HW_PXP_INPUT_STORE_CTRL_CH0 field descriptions (continued)

Field	Description
	0x0 0 — combine 2 channel disable 0x1 1 — combine 2 channel enable
23–18 RSVD1	Reserved, always set to zero.
17–16 WR_NUM_ BYTES	Bytes in a write burst 0x0 8_bytes — 8 bytes 0x1 16_bytes — 16 bytes 0x2 32_bytes — 32 bytes 0x3 64_bytes — 64 bytes
15–12 RSVD2	Reserved, always set to zero.
11 FILL_DATA_EN	fill data enable 0x0 0 — Fill data mode disable. 0x1 1 — Fill data mode enable. When using fill_data mode, store_engine will store fixed data defined in fill_data register
10 PACK_IN_SEL	pack_in_sel 0x0 0 — select 64 shift out data to pack 0x1 1 — select low 32 bit shift out data to pack
9 STORE_ MEMORY_EN	store memory enable 0x0 0 — store memory mode disable. 0x1 1 — store memory mode enable. Data will store to memory
8 STORE_ BYPASS_EN	store bypass enable 0x0 0 — store bypass mode disable. 0x1 1 — store bypass mode enable. Data will bypass to store output.
7 RSVD3	Reserved, always set to zero.
6–5 ARRAY_LINE_ NUM	Selects Array Size 0x0 0 — Using 1x1 Array 0x1 1 — Using 3x3 Array 0x2 2 — Using 5x5 Array 0x3 3 — Using 5x5 Array
4 ARRAY_EN	0x0 0 — Array Handshake Disabled 0x1 1 — Array Handshake Enabled
3 HANDSHAKE_ EN	Enable bit for handshake with the store engine. 0x0 0 — Handshake with the prefetch engine is disabled 0x1 1 — Handshake with the prefetch engine is enabled
2 BLOCK_16	Determines the block size. 0x0 8x8 — Block size is 8x8 0x1 16x16 — Block size is 16x16

Table continues on the next page...

PXP_HW_PXP_INPUT_STORE_CTRL_CH0 field descriptions (continued)

Field	Description
1 BLOCK_EN	Choses the store mode. 0x0 0 — Store in scan mode 0x1 1 — Store in block mode
0 CH_EN	Channel enable. 0x0 0 — Store function is disable 0x1 1 — Store function is enable

42.11.84 Store engine Control Channel 1 Register (PXP_HW_PXP_INPUT_STORE_CTRL_CH1)

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_INPUT_STORE_CTRL_CH1: 0x5D0

HW_PXP_INPUT_STORE_CTRL_CH1_SET: 0x5D4

HW_PXP_INPUT_STORE_CTRL_CH1_CLR: 0x5D8

HW_PXP_INPUT_STORE_CTRL_CH1_TOG: 0x5DC

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 5D0h offset = 21C_C5D0h

PXP Memory Map/Register Definition

PXP_HW_PXP_INPUT_STORE_CTRL_CH1 field descriptions

Field	Description
31–18 RSVD0	Reserved, always set to zero.
17–16 WR_NUM_Bytes	Bytes in a write burst 0x0 8_bytes — 8 bytes 0x1 16_bytes — 16 bytes 0x2 32_bytes — 32 bytes 0x3 64_bytes — 64 bytes
15–11 RSVD1	Reserved, always set to zero.
10 PACK_IN_SEL	pack_in_sel 0x0 0 — select 64 shift out data to pack 0x1 1 — select channel 0 high 32 bit shift out data to pack
9 STORE_MEMORY_EN	store memory enable 0x0 0 — store memory mode disable. 0x1 1 — store memory mode enable. Data will store to memory.
8 STORE_BYPASS_EN	enable bit for store bypass 0x0 0 — store bypass mode disable. 0x1 1 — store bypass mode enable. Data will bypass to store output.
7 RSVD3	Reserved, always set to zero.
6–5 ARRAY_LINE_NUM	Selects Array Size 0x0 0 — Using 1x1 Array

Table continues on the next page...

PXP_HW_PXP_INPUT_STORE_CTRL_CH1 field descriptions (continued)

Field	Description
	0x1 1 — Using 3x3 Array 0x2 2 — Using 5x5 Array 0x3 3 — Using 5x5 Array
4 ARRAY_EN	0x0 0 — Array Handshake Disabled 0x1 1 — Array Handshake Enabled
3 HANDSHAKE_EN	Enable bit for handshake with the fetch engine. 0x0 0 — Handshake with the fetch engine is disabled 0x1 1 — Handshake with the fetch engine is enabled
2 BLOCK_16	Determines the block size. 0x0 8x8 — Block size is 8x8 0x1 16x16 — Block size is 16x16
1 BLOCK_EN	Chooses the store mode. 0x0 0 — Store in scan mode 0x1 1 — Store in block mode
0 CH_EN	Channel enable. 0x0 0 — Store function is disable 0x1 1 — Store function is enable

42.11.85 Store engine status Channel 0 Register (PXP_HW_PXP_INPUT_STORE_STATUS_CH0)

This register defines the status bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 5E0h offset = 21C_C5E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	STORE_BLOCK_Y																STORE_BLOCK_X															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_INPUT_STORE_STATUS_CH0 field descriptions

Field	Description
31–16 STORE_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.

Table continues on the next page...

PXP_HW_PXP_INPUT_STORE_STATUS_CH0 field descriptions (continued)

Field	Description
STORE_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

42.11.86 Store engine status Channel 1 Register (PXP_HW_PXP_INPUT_STORE_STATUS_CH1)

This register defines the status bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 5F0h offset = 21C_C5F0h

PXP_HW_PXP_INPUT_STORE_STATUS_CH1 field descriptions

Field	Description
31-16 STORE_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.
STORE_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

42.11.87 PXP_HW_PXP_INPUT_STORE_SIZE_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 600h offset = 21C_C600h

PXP_HW_PXP_INPUT_STORE_SIZE_CH0 field descriptions

Field	Description
31–16 OUT_HEIGHT	actual output height -1
OUT_WIDTH	actual output width -1

42.11.88 PXP_HW_PXP_INPUT_STORE_SIZE_CH1

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 610h offset = 21C_C610h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	OUT_HEIGHT																OUT_WIDTH															
W	OUT_HEIGHT																OUT_WIDTH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_INPUT_STORE_SIZE_CH1 field descriptions

Field	Description
31–16 OUT_HEIGHT	actual output height -1
OUT_WIDTH	actual output width -1

42.11.89 PXP_HW_PXP_INPUT_STORE_PITCH

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 620h offset = 21C_C620h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	CH1_OUT_PITCH																CH0_OUT_PITCH															
W	CH1_OUT_PITCH																CH0_OUT_PITCH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_INPUT_STORE_PITCH field descriptions

Field	Description
31-16 CH1_OUT_PITCH	This field indicates the channel 1 input pitch
CH0_OUT_PITCH	This field indicates the channel 0 input pitch

42.11.90 PXP_HW_PXP_INPUT_STORE_SHIFT_CTRL_CH0

This register defines the control bits for the pxp store_engine sub-block.

HW_PXP_INPUT_STORE_SHIFT_CTRL_CH0: 0x630

HW_PXP_INPUT_STORE_SHIFT_CTRL_CH0_SET: 0x634

HW_PXP_INPUT_STORE_SHIFT_CTRL_CH0_CLR: 0x638

HW_PXP_INPUT_STORE_SHIFT_CTRL_CH0_TOG: 0x63C

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 630h offset = 21C_C630h

PXP_HW_PXP_INPUT_STORE_SHIFT_CTRL_CH0 field descriptions

Field	Description
31–8 RSVD0	Reserved, always set to zero.
7 SHIFT_BYPASS	CH0 shift bypass 0x0 0 — data will do shift processing. 0x1 1 — data will bypass shift module.
6 RSVD1	Reserved, always set to zero.
5 OUT_YUV422_2P_EN	Enable for YUV422 2 plane 0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
4 OUT_YUV422_1P_EN	Enable for YUV422 1 plane 0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
3–2 OUTPUT_ACTIVE_BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits
RSVD2	Reserved, always set to zero.

42.11.91 PXP_HW_PXP_INPUT_STORE_SHIFT_CTRL_CH1

This register defines the control bits for the pxp store_engine sub-block.

PXP Memory Map/Register Definition

HW_PXP_INPUT_STORE_SHIFT_CTRL_CH1: 0x640

HW_PXP_INPUT_STORE_SHIFT_CTRL_CH1_SET: 0x644

HW_PXP_INPUT_STORE_SHIFT_CTRL_CH1_CLR: 0x648

HW_PXP_INPUT_STORE_SHIFT_CTRL_CH1_TOG: 0x64C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 640h offset = 21C_C640h

PXP_HW_PXP_INPUT_STORE_SHIFT_CTRL_CH1 field descriptions

Field	Description
31–6 RSVD0	Reserved, always set to zero.
5 OUT_YUV422_2P_EN	Enable for YUV422 2 plane

Table continues on the next page...

PXP_HW_PXP_INPUT_STORE_SHIFT_CTRL_CH1 field descriptions (continued)

Field	Description
	0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
4 OUT_YUV422_1P_EN	Enable for YUV422 1 plane 0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
3–2 OUTPUT_ACTIVE_BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits
RSVD2	Reserved, always set to zero.

42.11.92 PXP_HW_PXP_INPUT_STORE_ADDR_0_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 690h offset = 21C_C690h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R																		OUT_BASE_ADDR0																
W																																		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

PXP_HW_PXP_INPUT_STORE_ADDR_0_CH0 field descriptions

Field	Description
OUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

42.11.93 PXP_HW_PXP_INPUT_STORE_ADDR_1_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + 6A0h offset = 21C_C6A0h

PXP_HW_PXP_INPUT_STORE_ADDR_1_CH0 field descriptions

Field	Description
OUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel 1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

42.11.94 PXP_HW_PXP_INPUT_STORE_FILL_DATA_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 6B0h offset = 21C_C6B0h

PXP_HW_PXP_INPUT_STORE_FILL_DATA_CH0 field descriptions

Field	Description
FILL_DATA_CH0	when using fill_data mode,store engine channel0 will store the fill_data value defined here.

42.11.95 PXP_HW_PXP_INPUT_STORE_ADDR_0_CH1

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 6C0h offset = 21C_C6C0h

PXP_HW_PXP_INPUT_STORE_ADDR_0_CH1 field descriptions

Field	Description
OUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

42.11.96 PXP_HW_PXP_INPUT_STORE_ADDR_1_CH1

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 6D0h offset = 21C_C6D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_INPUT_STORE_ADDR_1_CH1 field descriptions

Field	Description
OUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel 1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

42.11.97 PXP_HW_PXP_INPUT_STORE_D_MASK0_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 6E0h offset = 21C_C6E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_INPUT_STORE_D_MASK0_H_CH0 field descriptions

Field	Description
D_MASK0_H_CH0	data mask0 high byte

42.11.98 PXP_HW_PXP_INPUT_STORE_D_MASK0_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 6F0h offset = 21C_C6F0h

PXP_HW_PXP_INPUT_STORE_D_MASK0_L_CH0 field descriptions

Field	Description
D_MASK0_L_CH0	data mask0 low byte

42.11.99 PXP_HW_PXP_INPUT_STORE_D_MASK1_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 700h offset = 21C_C700h

PXP_HW_PXP_INPUT_STORE_D_MASK1_H_CH0 field descriptions

Field	Description
D_MASK1_H_CH0	data mask1 high byte

42.11.100 PXP_HW_PXP_INPUT_STORE_D_MASK1_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 710h offset = 21C_C710h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_INPUT_STORE_D_MASK2_H_CH0 field descriptions

Field	Description
D_MASK2_H_CH0	data mask2 high byte

42.11.102 PXP_HW_PXP_INPUT_STORE_D_MASK2_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + 730h offset = 21C_C730h

PXP_HW_PXP_INPUT_STORE_D_MASK2_L_CH0 field descriptions

Field	Description
D_MASK2_L_CH0	data mask2 low byte

42.11.103 PXP_HW_PXP_INPUT_STORE_D_MASK3_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 740h offset = 21C_C740h

PXP_HW_PXP_INPUT_STORE_D_MASK3_H_CH0 field descriptions

Field	Description
D_MASK3_H_CH0	data mask3 high byte

42.11.104 PXP_HW_PXP_INPUT_STORE_D_MASK3_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 750h offset = 21C_C750h

PXP_HW_PXP_INPUT_STORE_D_MASK3_L_CH0 field descriptions

Field	Description
D_MASK3_L_CH0	data mask3 low byte

42.11.105 PXP_HW_PXP_INPUT_STORE_D_MASK4_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 760h offset = 21C_C760h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_INPUT_STORE_D_MASK4_L_CH0 field descriptions

Field	Description
D_MASK4_L_CH0	data mask4 low byte

42.11.107 PXP_HW_PXP_INPUT_STORE_D_MASK5_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 780h offset = 21C_C780h

PXP_HW_PXP_INPUT_STORE_D_MASK5_H_CH0 field descriptions

Field	Description
D_MASK5_H_CH0	data mask5 high byte

42.11.108 PXP_HW_PXP_INPUT_STORE_D_MASK5_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 790h offset = 21C_C790h

PXP_HW_PXP_INPUT_STORE_D_MASK5_L_CH0 field descriptions

Field	Description
D_MASK5_L_CH0	data mask5 low byte

42.11.109 PXP_HW_PXP_INPUT_STORE_D_MASK6_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 7A0h offset = 21C_C7A0h

PXP_HW_PXP_INPUT_STORE_D_MASK6_H_CH0 field descriptions

Field	Description
D_MASK6_H_CH0	data mask6 high byte

42.11.110 PXP_HW_PXP_INPUT_STORE_D_MASK6_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 7B0h offset = 21C_C7B0h

PXP_HW_PXP_INPUT_STORE_D_MASK6_L_CH0 field descriptions

Field	Description
D_MASK6_L_CH0	data mask6 low byte

42.11.111 PXP_HW_PXP_INPUT_STORE_D_MASK7_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + 7C0h offset = 21C_C7C0h

PXP_HW_PXP_INPUT_STORE_D_MASK7_H_CH0 field descriptions

Field	Description
D_MASK7_H_CH0	data mask7 high byte

42.11.112 PXP_HW_PXP_INPUT_STORE_D_MASK7_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 7E0h offset = 21C_C7E0h

PXP_HW_PXP_INPUT_STORE_D_MASK7_L_CH0 field descriptions

Field	Description
D_MASK7_L_CH0	data mask7 low byte

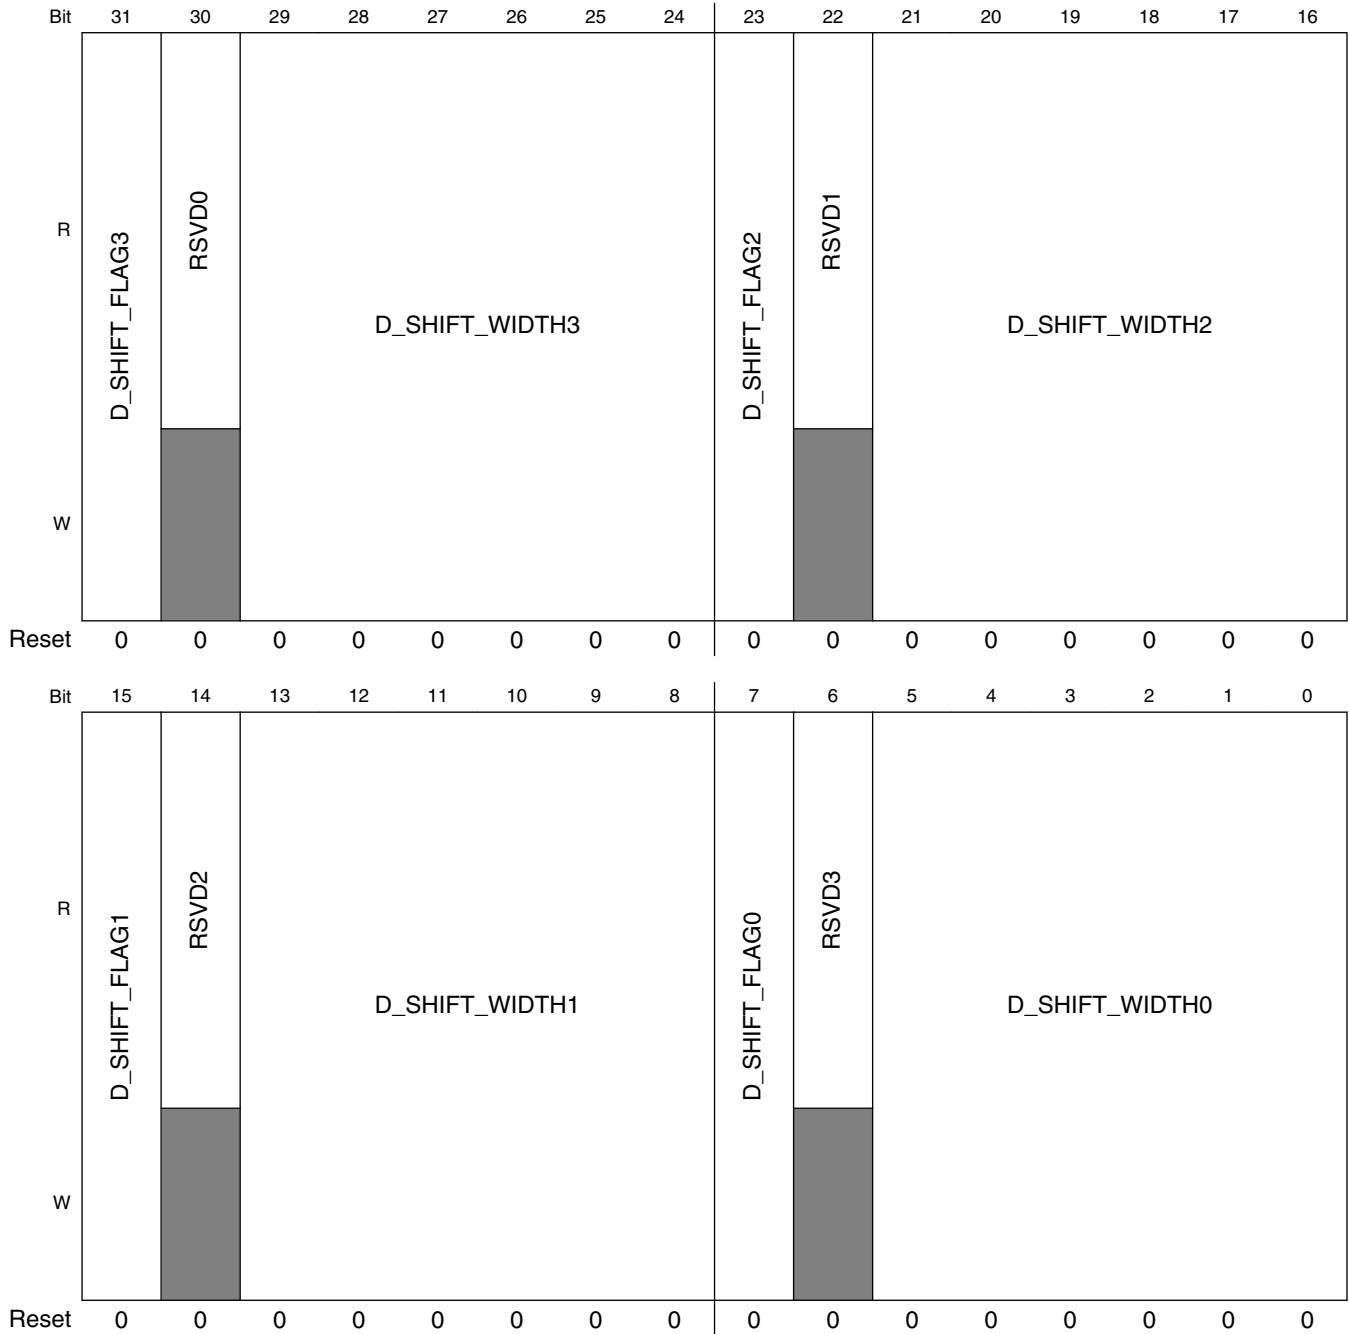

42.11.113 PXP_HW_PXP_INPUT_STORE_D_SHIFT_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 7F0h offset = 21C_C7F0h

PXP_HW_PXP_INPUT_STORE_D_SHIFT_L_CH0 field descriptions

Field	Description
31 D_SHIFT_FLAG3	data shift flag 3
30 RSVD0	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_INPUT_STORE_D_SHIFT_L_CH0 field descriptions (continued)

Field	Description
29–24 D_SHIFT_ WIDTH3	data shift width 3
23 D_SHIFT_FLAG2	data shift flag 2
22 RSVD1	Reserved, always set to zero.
21–16 D_SHIFT_ WIDTH2	data shift width 2
15 D_SHIFT_FLAG1	data shift flag 1
14 RSVD2	Reserved, always set to zero.
13–8 D_SHIFT_ WIDTH1	data shift width 1
7 D_SHIFT_FLAG0	data shift flag 0
6 RSVD3	Reserved, always set to zero.
D_SHIFT_ WIDTH0	data shift width 0

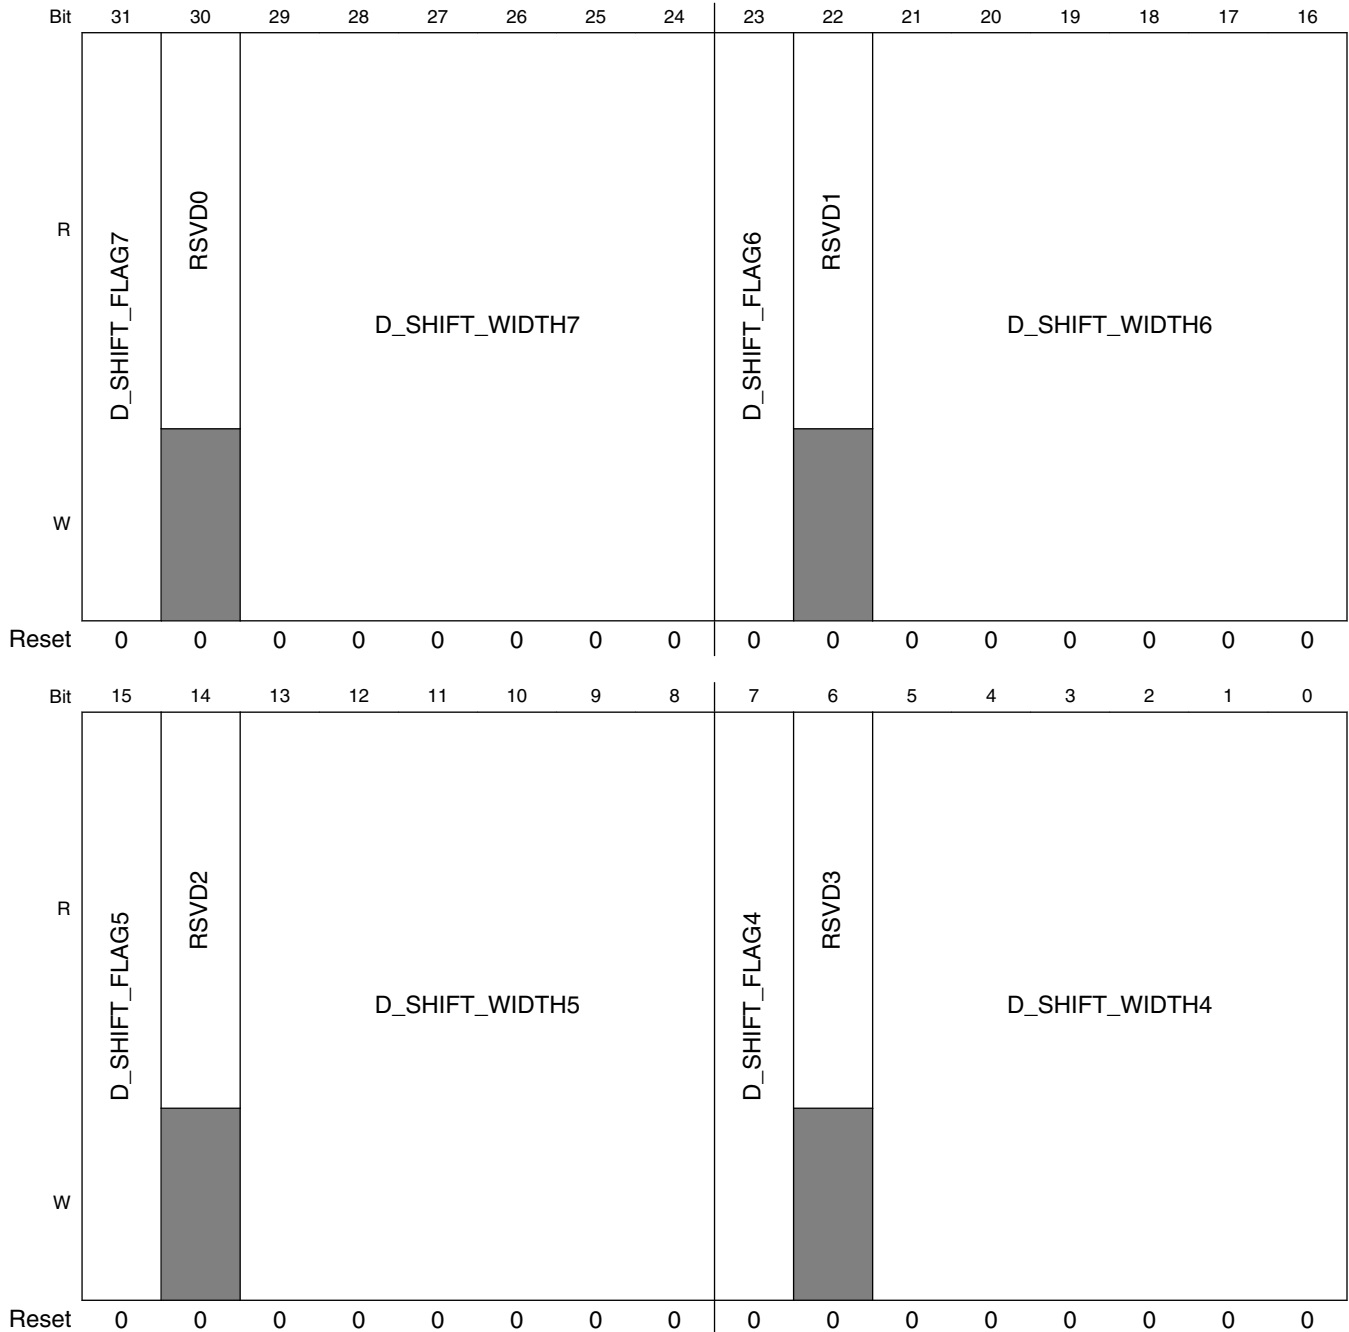

42.11.114 PXP_HW_PXP_INPUT_STORE_D_SHIFT_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 800h offset = 21C_C800h

PXP_HW_PXP_INPUT_STORE_D_SHIFT_H_CH0 field descriptions

Field	Description
31 D_SHIFT_FLAG7	data shift flag 7
30 RSVD0	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_INPUT_STORE_D_SHIFT_H_CH0 field descriptions (continued)

Field	Description
29–24 D_SHIFT_ WIDTH7	data shift width 3
23 D_SHIFT_FLAG6	data shift flag 6
22 RSVD1	Reserved, always set to zero.
21–16 D_SHIFT_ WIDTH6	data shift width 6
15 D_SHIFT_FLAG5	data shift flag 5
14 RSVD2	Reserved, always set to zero.
13–8 D_SHIFT_ WIDTH5	data shift width 5
7 D_SHIFT_FLAG4	data shift flag 4
6 RSVD3	Reserved, always set to zero.
D_SHIFT_ WIDTH4	data shift width 4

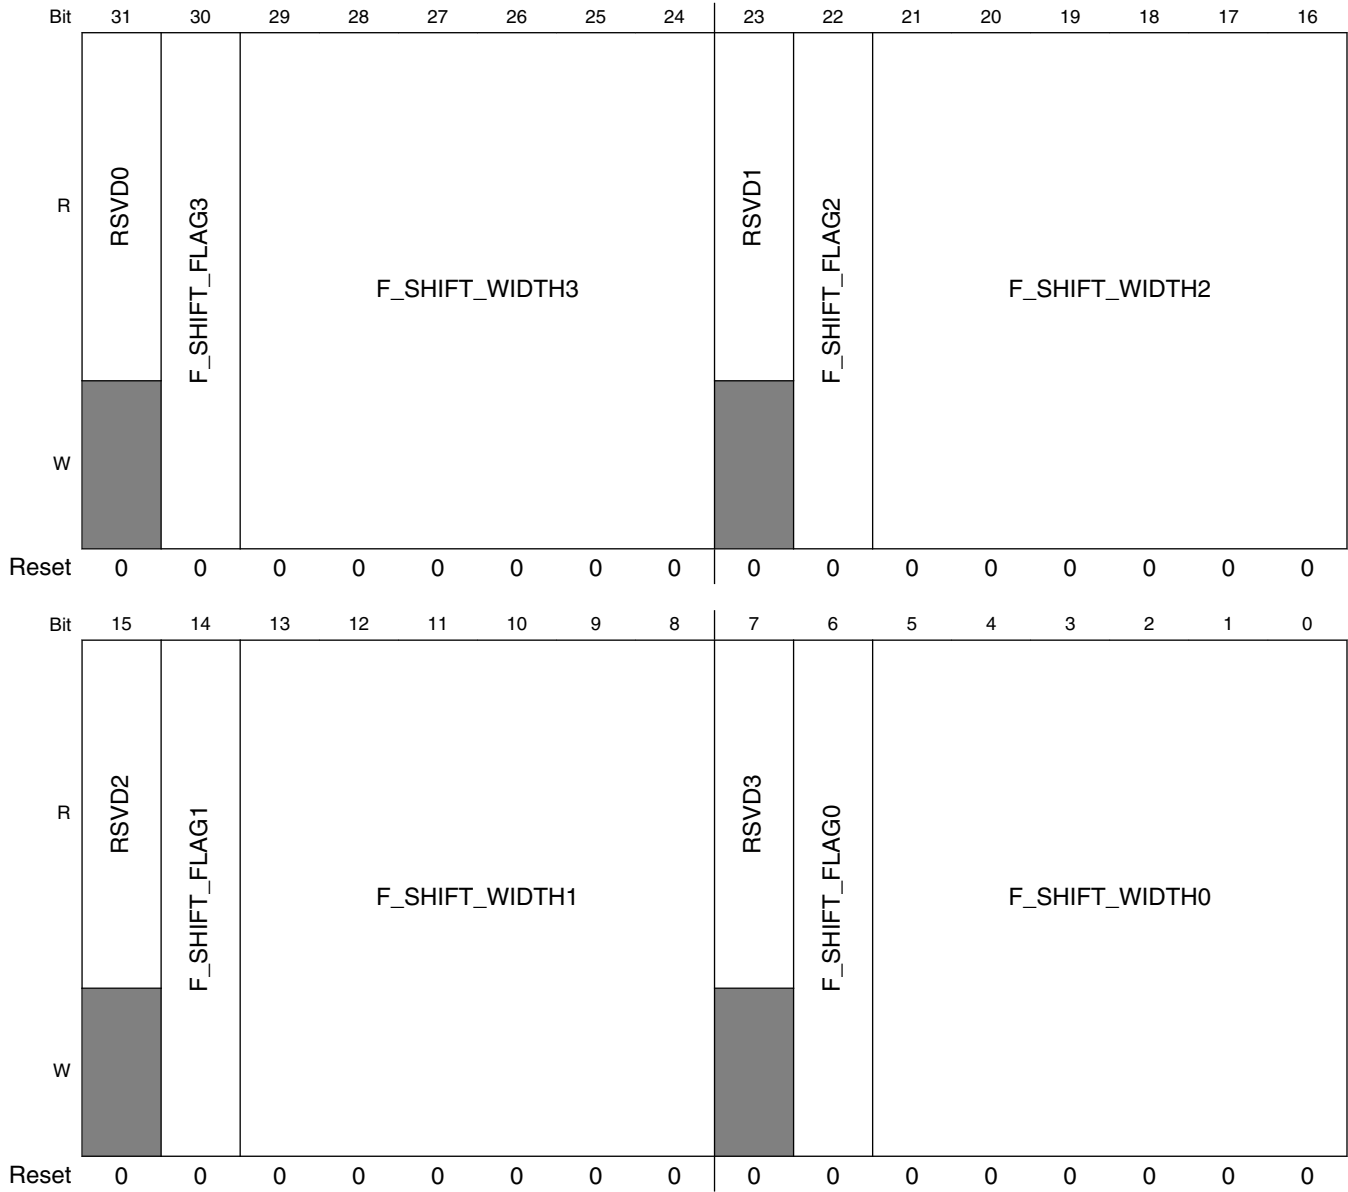

42.11.115 PXP_HW_PXP_INPUT_STORE_F_SHIFT_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 810h offset = 21C_C810h

PXP_HW_PXP_INPUT_STORE_F_SHIFT_L_CH0 field descriptions

Field	Description
31 RSVD0	Reserved, always set to zero.
30 F_SHIFT_FLAG3	flag shift flag3
29-24 F_SHIFT_WIDTH3	flag shift width 3
23 RSVD1	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_INPUT_STORE_F_SHIFT_L_CH0 field descriptions (continued)

Field	Description
22 F_SHIFT_FLAG2	flag shift flag2
21–16 F_SHIFT_WIDTH2	flag shift width 2
15 RSVD2	Reserved, always set to zero.
14 F_SHIFT_FLAG1	flag shift flag1
13–8 F_SHIFT_WIDTH1	flag shift width 1
7 RSVD3	Reserved, always set to zero.
6 F_SHIFT_FLAG0	flag shift flag0
F_SHIFT_WIDTH0	flag shift width 0

42.11.116 PXP_HW_PXP_INPUT_STORE_F_SHIFT_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 820h offset = 21C_C820h

PXP_HW_PXP_INPUT_STORE_F_SHIFT_H_CH0 field descriptions

Field	Description
31 RSVD0	Reserved, always set to zero.
30 F_SHIFT_FLAG7	flag shift flag7
29–24 F_SHIFT_WIDTH7	flag shift width 7
23 RSVD1	Reserved, always set to zero.
22 F_SHIFT_FLAG6	flag shift flag6
21–16 F_SHIFT_WIDTH6	flag shift width 5
15 RSVD2	Reserved, always set to zero.
14 F_SHIFT_FLAG5	flag shift flag5
13–8 F_SHIFT_WIDTH5	flag shift width 5
7 RSVD3	Reserved, always set to zero.
6 F_SHIFT_FLAG4	flag shift flag4
F_SHIFT_WIDTH4	flag shift width 4

42.11.117 PXP_HW_PXP_INPUT_STORE_F_MASK_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 830h offset = 21C_C830h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_INPUT_STORE_F_MASK_H_CH0 field descriptions

Field	Description
31–24 F_MASK7	flag mask7

Table continues on the next page...

PXP_HW_PXP_INPUT_STORE_F_MASK_H_CH0 field descriptions (continued)

Field	Description
23–16 F_MASK6	flag mask6
15–8 F_MASK5	flag mask5
F_MASK4	flag mask4

42.11.119 Pre-fetch engine Control Channel 0 Register (PXP_HW_PXP_DITHER_FETCH_CTRL_CH0)

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_DITHER_FETCH_CTRL_CH0: 0x850

HW_PXP_DITHER_FETCH_CTRL_CH0_SET: 0x854

HW_PXP_DITHER_FETCH_CTRL_CH0_CLR: 0x858

HW_PXP_DITHER_FETCH_CTRL_CH0_TOG: 0x85C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 850h offset = 21C_C850h

PXP Memory Map/Register Definition

PXP_HW_PXP_DITHER_FETCH_CTRL_CH0 field descriptions

Field	Description
31 ARBIT_EN	Enables Arbitration 0x0 0 — Arbitration disable. If using 2 channels, will output 2 axi bus sets. 0x1 1 — Arbitration enable. If using 2 channel, will only output 1 axi bus sets
30–26 RSVD0	Reserved, always set to zero.
25–24 HANDSHAKE_SCAN_LINE_NUM	scan handshake line number 0x0 0 — 1 line. 0x1 1 — 8 lines 0x2 2 — 16 lines 0x3 3 — 16 lines
23–18 RSVD1	Reserved, always set to zero.
17–16 RD_NUM_BYTES	Bytes in a read burst 0x0 8_bytes — 8 bytes. 0x1 16_bytes — 16 bytes. 0x2 32_bytes — 32 bytes. 0x3 64_bytes — 64 bytes.
15–14 RSVD2	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_DITHER_FETCH_CTRL_CH0 field descriptions (continued)

Field	Description
13–12 ROTATION_ANGLE	0x0 ROT_0 — Rotate image by 0 degrees. 0x1 ROT_90 — Rotate image by 90 degrees. 0x2 ROT_180 — Rotate image by 180 degrees. 0x3 ROT_270 — Rotate image by 270 degrees.
11 RSVD3	Reserved, always set to zero.
10 VFLIP	Enables VFLIP 0x0 0 — VFLIP disable 0x1 1 — VFLIP enable
9 HFLIP	Enables HFLIP. 0x0 0 — HFLIP disable 0x1 1 — VFLIP enable
8–6 RSVD4	Reserved, always set to zero.
5 HIGH_BYTE	channel 0 high byte selection 0x0 0 — In 64 bit mode, the output high byte will use channel1. 0x1 1 — In 64 bit mode, the output high byte will use channel0
4 BYPASS_PIXEL_EN	Selects Channel 0 pixel source 0x0 0 — Channel 0 is from memory 0x1 1 — Channel 0 is from previous process engine
3 HANDSHAKE_EN	Enable bit for handshake with the store engine. 0x0 0 — Handshake with the store engine is disabled 0x1 1 — Handshake with the store engine is enabled
2 BLOCK_16	Determines the block size. 0x0 8x8 — Block size is 8x8 0x1 16x16 — Block size is 16x16
1 BLOCK_EN	Chooses the prefetch mode. 0x0 0 — Prefetch in scan mode 0x1 1 — Prefetch in block mode
0 CH_EN	Channel enable. 0x0 0 — Prefetch function is disable 0x1 1 — Prefetch function is enable

42.11.120 Pre-fetch engine Control Channel 1 Register (PXP_HW_PXP_DITHER_FETCH_CTRL_CH1)

This register defines the control bits for the pxp prefetch_engine sub-block.

PXP Memory Map/Register Definition

HW_PXP_DITHER_FETCH_CTRL_CH1: 0x860

HW_PXP_DITHER_FETCH_CTRL_CH1_SET: 0x864

HW_PXP_DITHER_FETCH_CTRL_CH1_CLR: 0x868

HW_PXP_DITHER_FETCH_CTRL_CH1_TOG: 0x86C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 860h offset = 21C_C860h

PXP_HW_PXP_DITHER_FETCH_CTRL_CH1 field descriptions

Field	Description
31–26 RSVD0	Reserved, always set to zero.
25–24 HANDSHAKE_ SCAN_LINE_ NUM	scan handshake line number 0x0 0 — 1 line. 0x1 1 — 8 lines 0x2 2 — 16 lines 0x3 3 — 16 lines
23–18 RSVD1	Reserved, always set to zero.
17–16 RD_NUM_ BYTES	Bytes in a read burst 0x0 8_bytes — 8 bytes. 0x1 16_bytes — 16 bytes. 0x2 32_bytes — 32 bytes. 0x3 64_bytes — 64 bytes.
15–14 RSVD2	Reserved, always set to zero.
13–12 ROTATION_ ANGLE	0x0 ROT_0 — Rotate image by 0 degrees. 0x1 ROT_90 — Rotate image by 90 degrees. 0x2 ROT_180 — Rotate image by 180 degrees. 0x3 ROT_270 — Rotate image by 270 degrees.

Table continues on the next page...

PXP_HW_PXP_DITHER_FETCH_CTRL_CH1 field descriptions (continued)

Field	Description
11 RSVD3	Reserved, always set to zero.
10 VFLIP	Enables VFLIP 0x0 0 — VFLIP disable 0x1 1 — VFLIP enable
9 HFLIP	Enables HFLIP. 0x0 0 — HFLIP disable 0x1 1 — VFLIP enable
8–5 RSVD4	Reserved, always set to zero.
4 BYPASS_ PIXEL_EN	Selects Channel 1 pixel source 0x0 0 — Channel 1 is from memory 0x1 1 — Channel 1 is from previous process engine
3 HANDSHAKE_ EN	Enable bit for handshake with the store engine. 0x0 0 — Handshake with the store engine is disabled 0x1 1 — Handshake with the store engine is enabled
2 BLOCK_16	Determines the block size. 0x0 8x8 — Block size is 8x8 0x1 16x16 — Block size is 16x16
1 BLOCK_EN	Choses the prefetch mode. 0x0 0 — Prefetch in scan mode 0x1 1 — Prefetch in block mode
0 CH_EN	Channel enable. 0x0 0 — Prefetch function is disable 0x1 1 — Prefetch function is enable

42.11.121 Pre-fetch engine status Channel 0 Register (PXP_HW_PXP_DITHER_FETCH_STATUS_CH0)

This register defines the status bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 870h offset = 21C_C870h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	PREFETCH_BLOCK_Y																PREFETCH_BLOCK_X																
W	[Shaded]																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_DITHER_FETCH_STATUS_CH0 field descriptions

Field	Description
31–16 PREFETCH_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.
PREFETCH_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

42.11.122 Store engine status Channel 1 Register (PXP_HW_PXP_DITHER_FETCH_STATUS_CH1)

This register defines the status bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 880h offset = 21C_C880h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	PREFETCH_BLOCK_Y																PREFETCH_BLOCK_X																
W	[Shaded]																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_DITHER_FETCH_STATUS_CH1 field descriptions

Field	Description
31–16 PREFETCH_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.
PREFETCH_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

42.11.123 PXP_HW_PXP_DITHER_FETCH_ACTIVE_SIZE_ULC_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 890h offset = 21C_C890h

PXP_HW_PXP_DITHER_FETCH_ACTIVE_SIZE_ULC_CH0 field descriptions

Field	Description
31–16 ACTIVE_SIZE_ULC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_ULC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

42.11.124 PXP_HW_PXP_DITHER_FETCH_ACTIVE_SIZE_LRC_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 8A0h offset = 21C_C8A0h

PXP_HW_PXP_DITHER_FETCH_ACTIVE_SIZE_LRC_CH0 field descriptions

Field	Description
31–16 ACTIVE_SIZE_LRC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_LRC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

42.11.125 PXP_HW_PXP_DITHER_FETCH_ACTIVE_SIZE_ULC_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 8B0h offset = 21C_C8B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ACTIVE_SIZE_ULC_Y																ACTIVE_SIZE_ULC_X															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_DITHER_FETCH_ACTIVE_SIZE_ULC_CH1 field descriptions

Field	Description
31–16 ACTIVE_SIZE_ULC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_ULC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

42.11.126 PXP_HW_PXP_DITHER_FETCH_ACTIVE_SIZE_LRC_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 8C0h offset = 21C_C8C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ACTIVE_SIZE_LRC_Y																ACTIVE_SIZE_LRC_X															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_DITHER_FETCH_ACTIVE_SIZE_LRC_CH1 field descriptions

Field	Description
31–16 ACTIVE_SIZE_LRC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_LRC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

42.11.127 PXP_HW_PXP_DITHER_FETCH_SIZE_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 8D0h offset = 21C_C8D0h

PXP_HW_PXP_DITHER_FETCH_SIZE_CH0 field descriptions

Field	Description
31–16 INPUT_TOTAL_HEIGHT	actual total height -1
INPUT_TOTAL_WIDTH	actual total width -1

42.11.128 PXP_HW_PXP_DITHER_FETCH_SIZE_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 8E0h offset = 21C_C8E0h

PXP_HW_PXP_DITHER_FETCH_SIZE_CH1 field descriptions

Field	Description
31–16 INPUT_TOTAL_HEIGHT	acutal total height -1
INPUT_TOTAL_WIDTH	actual_total_width -1

42.11.129 PXP_HW_PXP_DITHER_FETCH_BACKGROUND_COLOR_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 8F0h offset = 21C_C8F0h

**PXP_HW_PXP_DITHER_FETCH_BACKGROUND_COLOR_CH0 field descriptions**

Field	Description
BACKGROUND_COLOR	background color(in 32bpp format) for any pixels not within the buffer range specified by the ULC/LRC

42.11.130 PXP_HW_PXP_DITHER_FETCH_BACKGROUND_COLOR_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 900h offset = 21C_C900h

**PXP_HW_PXP_DITHER_FETCH_BACKGROUND_COLOR_CH1 field descriptions**

Field	Description
BACKGROUND_COLOR	background color(in 32bpp format) for any pixels not within the buffer range specified by the ULC/LRC

42.11.131 PXP_HW_PXP_DITHER_FETCH_PITCH

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + 910h offset = 21C_C910h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_DITHER_FETCH_PITCH field descriptions

Field	Description
31–16 CH1_INPUT_PITCH	This field indicates the channel 1 input pitch
CH0_INPUT_PITCH	This field indicates the channel 0 input pitch

42.11.132 PXP_HW_PXP_DITHER_FETCH_SHIFT_CTRL_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_DITHER_FETCH_SHIFT_CTRL_CH0: 0x920

HW_PXP_DITHER_FETCH_SHIFT_CTRL_CH0_SET: 0x924

HW_PXP_DITHER_FETCH_SHIFT_CTRL_CH0_CLR: 0x928

HW_PXP_DITHER_FETCH_SHIFT_CTRL_CH0_TOG: 0x92C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 920h offset = 21C_C920h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_DITHER_FETCH_SHIFT_CTRL_CH0 field descriptions

Field	Description
31–13 RSVD0	Reserved, always set to zero.
12 SHIFT_BYPASS	0x0 0 — channel0 data will do shift function 0x1 1 — channel0 will bypass shift function
11 EXPAND_EN	0x0 0 — channel0 format expanding disable 0x1 1 — channel0 format expanding enable
10–8 EXPAND_FORMAT	Select Pixel format 0x0 0 — RGB 565 0x1 1 — RGB 555 0x2 2 — ARGB 1555 0x3 3 — RGB 444 0x4 4 — ARGB 4444 0x5 5 — YUYV/YVYU 0x6 6 — UYVY/VYUY 0x7 7 — YUV422_2P
7–2 RSVD1	Reserved, always set to zero.

7–5 RSVD3	Reserved, always set to zero.
OFFSET0	Shift Offset for channel 0 component 0.

42.11.135 PXP_HW_PXP_DITHER_FETCH_SHIFT_OFFSET_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_DITHER_FETCH_SHIFT_OFFSET_CH1: 0x950

HW_PXP_DITHER_FETCH_SHIFT_OFFSET_CH1_SET: 0x954

HW_PXP_DITHER_FETCH_SHIFT_OFFSET_CH1_CLR: 0x958

HW_PXP_DITHER_FETCH_SHIFT_OFFSET_CH1_TOG: 0x95C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 950h offset = 21C_C950h

PXP_HW_PXP_DITHER_FETCH_SHIFT_OFFSET_CH1 field descriptions

Field	Description
31–29 RSVD0	Reserved, always set to zero.
28–24 OFFSET3	Shift Offset for channel 1 component 3.
23–21 RSVD1	Reserved, always set to zero.
20–16 OFFSET2	Shift Offset for channel 1 component 2.
15–13 RSVD2	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_DITHER_FETCH_SHIFT_OFFSET_CH1 field descriptions (continued)

Field	Description
12–8 OFFSET1	Shift Offset for channel 1 component 1.
7–5 RSVD3	Reserved, always set to zero.
OFFSET0	Shift Offset for channel 1 component 0.

42.11.136 PXP_HW_PXP_DITHER_FETCH_SHIFT_WIDTH_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_DITHER_FETCH_SHIFT_WIDTH_CH0: 0x960

HW_PXP_DITHER_FETCH_SHIFT_WIDTH_CH0_SET: 0x964

HW_PXP_DITHER_FETCH_SHIFT_WIDTH_CH0_CLR: 0x968

HW_PXP_DITHER_FETCH_SHIFT_WIDTH_CH0_TOG: 0x96C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 960h offset = 21C_C960h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0																WIDTH3			WIDTH2			WIDTH1			WIDTH0						
W	[Shaded]																[Shaded]			[Shaded]			[Shaded]			[Shaded]						
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	1	0	0	0	1	0	0	0

PXP_HW_PXP_DITHER_FETCH_SHIFT_WIDTH_CH0 field descriptions

Field	Description
31–16 RSVD0	Reserved, always set to zero.
15–12 WIDTH3	Shift Width for channel 0 component 3.
11–8 WIDTH2	Shift Width for channel 0 component 2.
7–4 WIDTH1	Shift Width for channel 0 component 1.
WIDTH0	Shift Width for channel 0 component 0.

42.11.137 PXP_HW_PXP_DITHER_FETCH_SHIFT_WIDTH_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_DITHER_FETCH_SHIFT_WIDTH_CH1: 0x970

HW_PXP_DITHER_FETCH_SHIFT_WIDTH_CH1_SET: 0x974

HW_PXP_DITHER_FETCH_SHIFT_WIDTH_CH1_CLR: 0x978

HW_PXP_DITHER_FETCH_SHIFT_WIDTH_CH1_TOG: 0x97C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 970h offset = 21C_C970h

PXP_HW_PXP_DITHER_FETCH_SHIFT_WIDTH_CH1 field descriptions

Field	Description
31–16 RSVD0	Reserved, always set to zero.
15–12 WIDTH3	Shift Width for channel 1 component 3.
11–8 WIDTH2	Shift Width for channel 1 component 2.
7–4 WIDTH1	Shift Width for channel 1 component 1.
WIDTH0	Shift Width for channel 1 component 0.

42.11.138 PXP_HW_PXP_DITHER_FETCH_ADDR_0_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 980h offset = 21C_C980h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_DITHER_FETCH_ADDR_0_CH0 field descriptions

Field	Description
INPUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

42.11.139 PXP_HW_PXP_DITHER_FETCH_ADDR_1_CH0

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 990h offset = 21C_C990h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_DITHER_FETCH_ADDR_1_CH0 field descriptions

Field	Description
INPUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

42.11.140 PXP_HW_PXP_DITHER_FETCH_ADDR_0_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 9A0h offset = 21C_C9A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_DITHER_FETCH_ADDR_0_CH1 field descriptions

Field	Description
INPUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

42.11.141 PXP_HW_PXP_DITHER_FETCH_ADDR_1_CH1

This register defines the control bits for the pxp prefetch_engine sub-block.

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 9B0h offset = 21C_C9B0h

PXP_HW_PXP_DITHER_FETCH_ADDR_1_CH1 field descriptions

Field	Description
INPUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

42.11.142 Store engine Control Channel 0 Register (PXP_HW_PXP_DITHER_STORE_CTRL_CH0)

This register defines the control bits for the pxp store_engine sub-block.

HW_PXP_DITHER_STORE_CTRL_CH0: 0x9C0

HW_PXP_DITHER_STORE_CTRL_CH0_SET: 0x9C4

HW_PXP_DITHER_STORE_CTRL_CH0_CLR: 0x9C8

HW_PXP_DITHER_STORE_CTRL_CH0_TOG: 0x9CC

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 9C0h offset = 21C_C9C0h

PXP_HW_PXP_DITHER_STORE_CTRL_CH0 field descriptions

Field	Description
31 ARBIT_EN	Arbitration Enable 0x0 0 — Arbitration disable. If using 2 channels, will output 2 axi bus sets 0x1 1 — Arbitration enable. If using 2 channel, will only output 1 axi bus sets
30–25 RSVD0	Reserved, always set to zero.
24 COMBINE_2CHANNEL	Combine 2 channel Enable

Table continues on the next page...

PXP_HW_PXP_DITHER_STORE_CTRL_CH0 field descriptions (continued)

Field	Description
	0x0 0 — combine 2 channel disable 0x1 1 — combine 2 channel enable
23–18 RSVD1	Reserved, always set to zero.
17–16 WR_NUM_ BYTES	Bytes in a write burst 0x0 8_bytes — 8 bytes 0x1 16_bytes — 16 bytes 0x2 32_bytes — 32 bytes 0x3 64_bytes — 64 bytes
15–12 RSVD2	Reserved, always set to zero.
11 FILL_DATA_EN	enable bit for fill data 0x0 0 — Fill data mode disable. 0x1 1 — Fill data mode enable. When using fill_data mode, store_engine will store fixed data defined in fill_data register
10 PACK_IN_SEL	pack_in_sel 0x0 0 — select 64 shift out data to pack 0x1 1 — select low 32 bit shift out data to pack
9 STORE_ MEMORY_EN	store memory enable 0x0 0 — store memory mode disable. 0x1 1 — store memory mode enable. Data will store to memory
8 STORE_ BYPASS_EN	enable bit for store bypass 0x0 0 — store bypass mode disable. 0x1 1 — store bypass mode enable. Data will bypass to store output.
7 RSVD3	Reserved, always set to zero.
6–5 ARRAY_LINE_ NUM	Selects Array Size 0x0 0 — Using 1x1 Array 0x1 1 — Using 3x3 Array 0x2 2 — Using 5x5 Array 0x3 3 — Using 5x5 Array
4 ARRAY_EN	0x0 0 — Array Handshake Disabled 0x1 1 — Array Handshake Enabled
3 HANDSHAKE_ EN	Enable bit for handshake with the store engine. 0x0 0 — Handshake with the prefetch engine is disabled 0x1 1 — Handshake with the prefetch engine is enabled
2 BLOCK_16	Determines the block size. 0x0 8x8 — Block size is 8x8 0x1 16x16 — Block size is 16x16

Table continues on the next page...

PXP_HW_PXP_DITHER_STORE_CTRL_CH0 field descriptions (continued)

Field	Description
1 BLOCK_EN	Choses the store mode. 0x0 0 — Store in scan mode 0x1 1 — Store in block mode
0 CH_EN	Channel enable. 0x0 0 — Store function is disable 0x1 1 — Store function is enable

42.11.143 Store engine Control Channel 1 Register (PXP_HW_PXP_DITHER_STORE_CTRL_CH1)

This register defines the control bits for the pxp prefetch_engine sub-block.

HW_PXP_DITHER_STORE_CTRL_CH1: 0x9D0

HW_PXP_DITHER_STORE_CTRL_CH1_SET: 0x9D4

HW_PXP_DITHER_STORE_CTRL_CH1_CLR: 0x9D8

HW_PXP_DITHER_STORE_CTRL_CH1_TOG: 0x9DC

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 9D0h offset = 21C_C9D0h

PXP Memory Map/Register Definition

PXP_HW_PXP_DITHER_STORE_CTRL_CH1 field descriptions

Field	Description
31–18 RSVD0	Reserved, always set to zero.
17–16 WR_NUM_Bytes	Bytes in a write burst 0x0 8_bytes — 8 bytes 0x1 16_bytes — 16 bytes 0x2 32_bytes — 32 bytes 0x3 64_bytes — 64 bytes
15–11 RSVD1	Reserved, always set to zero.
10 PACK_IN_SEL	pack_in_sel 0x0 0 — select 64 shift out data to pack 0x1 1 — select channel 0 high 32 bit shift out data to pack
9 STORE_MEMORY_EN	store memory enable 0x0 0 — store memory mode disable. 0x1 1 — store memory mode enable. Data will store to memory
8 STORE_BYPASS_EN	enable bit for store bypass 0x0 0 — store bypass mode disable. 0x1 1 — store bypass mode enable. Data will bypass to store output.
7 RSVD3	Reserved, always set to zero.
6–5 ARRAY_LINE_NUM	Selects Array Size 0x0 0 — Using 1x1 Array

Table continues on the next page...

PXP_HW_PXP_DITHER_STORE_CTRL_CH1 field descriptions (continued)

Field	Description
	0x1 1 — Using 3x3 Array 0x2 2 — Using 5x5 Array 0x3 3 — Using 5x5 Array
4 ARRAY_EN	0x0 0 — Array Handshake Disabled 0x1 1 — Array Handshake Enabled
3 HANDSHAKE_EN	Enable bit for handshake with the fetch engine. 0x0 0 — Handshake with the fetch engine is disabled 0x1 1 — Handshake with the fetch engine is enabled
2 BLOCK_16	Determines the block size. 0x0 8x8 — Block size is 8x8 0x1 16x16 — Block size is 16x16
1 BLOCK_EN	Chooses the store mode. 0x0 0 — Store in scan mode 0x1 1 — Store in block mode
0 CH_EN	Channel enable. 0x0 0 — Store function is disable 0x1 1 — Store function is enable

42.11.144 Store engine status Channel 0 Register (PXP_HW_PXP_DITHER_STORE_STATUS_CH0)

This register defines the status bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 9E0h offset = 21C_C9E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	STORE_BLOCK_Y																STORE_BLOCK_X															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_DITHER_STORE_STATUS_CH0 field descriptions

Field	Description
31–16 STORE_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.

Table continues on the next page...

PXP_HW_PXP_DITHER_STORE_STATUS_CH0 field descriptions (continued)

Field	Description
STORE_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

42.11.145 Store engine status Channel 1 Register (PXP_HW_PXP_DITHER_STORE_STATUS_CH1)

This register defines the status bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + 9F0h offset = 21C_C9F0h

PXP_HW_PXP_DITHER_STORE_STATUS_CH1 field descriptions

Field	Description
31-16 STORE_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.
STORE_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

42.11.146 PXP_HW_PXP_DITHER_STORE_SIZE_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + A00h offset = 21C_CA00h

PXP_HW_PXP_DITHER_STORE_SIZE_CH0 field descriptions

Field	Description
31–16 OUT_HEIGHT	actual output height -1
OUT_WIDTH	actual output width -1

42.11.147 PXP_HW_PXP_DITHER_STORE_SIZE_CH1

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + A10h offset = 21C_CA10h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	OUT_HEIGHT																OUT_WIDTH															
W	OUT_HEIGHT																OUT_WIDTH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_DITHER_STORE_SIZE_CH1 field descriptions

Field	Description
31–16 OUT_HEIGHT	actual output height -1
OUT_WIDTH	actual output width -1

42.11.148 PXP_HW_PXP_DITHER_STORE_PITCH

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + A20h offset = 21C_CA20h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	CH1_OUT_PITCH																CH0_OUT_PITCH															
W	CH1_OUT_PITCH																CH0_OUT_PITCH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_DITHER_STORE_PITCH field descriptions

Field	Description
31-16 CH1_OUT_PITCH	This field indicates the channel 1 input pitch
CH0_OUT_PITCH	This field indicates the channel 0 input pitch

42.11.149 PXP_HW_PXP_DITHER_STORE_SHIFT_CTRL_CH0

This register defines the control bits for the pxp store_engine sub-block.

HW_PXP_DITHER_STORE_SHIFT_CTRL_CH0: 0xA30

HW_PXP_DITHER_STORE_SHIFT_CTRL_CH0_SET: 0xA34

HW_PXP_DITHER_STORE_SHIFT_CTRL_CH0_CLR: 0xA38

HW_PXP_DITHER_STORE_SHIFT_CTRL_CH0_TOG: 0xA3C

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + A30h offset = 21C_CA30h

PXP_HW_PXP_DITHER_STORE_SHIFT_CTRL_CH0 field descriptions

Field	Description
31–8 RSVD0	Reserved, always set to zero.
7 SHIFT_BYPASS	CH0 shift bypass 0x0 0 — data will do shift processing. 0x1 1 — data will bypass shift module.
6 RSVD1	Reserved, always set to zero.
5 OUT_YUV422_2P_EN	Enable for YUV422 2 plane 0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
4 OUT_YUV422_1P_EN	Enable for YUV422 1 plane 0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
3–2 OUTPUT_ACTIVE_BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits
RSVD2	Reserved, always set to zero.

42.11.150 PXP_HW_PXP_DITHER_STORE_SHIFT_CTRL_CH1

This register defines the control bits for the pxp store_engine sub-block.

PXP Memory Map/Register Definition

HW_PXP_DITHER_STORE_SHIFT_CTRL_CH1: 0xA40

HW_PXP_DITHER_STORE_SHIFT_CTRL_CH1_SET: 0xA44

HW_PXP_DITHER_STORE_SHIFT_CTRL_CH1_CLR: 0xA48

HW_PXP_DITHER_STORE_SHIFT_CTRL_CH1_TOG: 0xA4C

The Control register contains the control bits for the pxp prefetch_engine sub-block.

EXAMPLE

Address: 21C_C000h base + A40h offset = 21C_CA40h

PXP_HW_PXP_DITHER_STORE_SHIFT_CTRL_CH1 field descriptions

Field	Description
31–6 RSVD0	Reserved, always set to zero.
5 OUT_YUV422_2P_EN	Enable for YUV422 2 plane

Table continues on the next page...

PXP_HW_PXP_DITHER_STORE_SHIFT_CTRL_CH1 field descriptions (continued)

Field	Description
	0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
4 OUT_YUV422_1P_EN	Enable for YUV422 1 plane 0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
3–2 OUTPUT_ACTIVE_BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits
RSVD2	Reserved, always set to zero.

42.11.151 PXP_HW_PXP_DITHER_STORE_ADDR_0_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + A90h offset = 21C_CA90h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R																		OUT_BASE_ADDR0																
W																																		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

PXP_HW_PXP_DITHER_STORE_ADDR_0_CH0 field descriptions

Field	Description
OUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

42.11.152 PXP_HW_PXP_DITHER_STORE_ADDR_1_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + AA0h offset = 21C_CAA0h

PXP_HW_PXP_DITHER_STORE_ADDR_1_CH0 field descriptions

Field	Description
OUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel 1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

42.11.153 PXP_HW_PXP_DITHER_STORE_FILL_DATA_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + AB0h offset = 21C_CAB0h

PXP_HW_PXP_DITHER_STORE_FILL_DATA_CH0 field descriptions

Field	Description
FILL_DATA_CH0	when using fill_data mode,store engine channel0 will store the fill_data value defined here.

42.11.154 PXP_HW_PXP_DITHER_STORE_ADDR_0_CH1

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + AC0h offset = 21C_CAC0h

PXP_HW_PXP_DITHER_STORE_ADDR_0_CH1 field descriptions

Field	Description
OUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

42.11.155 PXP_HW_PXP_DITHER_STORE_ADDR_1_CH1

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + AD0h offset = 21C_CAD0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

PXP_HW_PXP_DITHER_STORE_ADDR_1_CH1 field descriptions

Field	Description
OUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel 1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

42.11.156 PXP_HW_PXP_DITHER_STORE_D_MASK0_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + AE0h offset = 21C_CAE0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_DITHER_STORE_D_MASK0_H_CH0 field descriptions

Field	Description
D_MASK0_H_CH0	data mask0 high byte

42.11.157 PXP_HW_PXP_DITHER_STORE_D_MASK0_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + AF0h offset = 21C_CAF0h

PXP_HW_PXP_DITHER_STORE_D_MASK0_L_CH0 field descriptions

Field	Description
D_MASK0_L_CH0	data mask0 low byte

42.11.158 PXP_HW_PXP_DITHER_STORE_D_MASK1_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + B00h offset = 21C_CB00h

PXP_HW_PXP_DITHER_STORE_D_MASK1_H_CH0 field descriptions

Field	Description
D_MASK1_H_CH0	data mask1 high byte

42.11.159 PXP_HW_PXP_DITHER_STORE_D_MASK1_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + B10h offset = 21C_CB10h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_DITHER_STORE_D_MASK2_H_CH0 field descriptions

Field	Description
D_MASK2_H_CH0	data mask2 high byte

42.11.161 PXP_HW_PXP_DITHER_STORE_D_MASK2_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + B30h offset = 21C_CB30h

PXP_HW_PXP_DITHER_STORE_D_MASK2_L_CH0 field descriptions

Field	Description
D_MASK2_L_CH0	data mask2 low byte

42.11.162 PXP_HW_PXP_DITHER_STORE_D_MASK3_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + B40h offset = 21C_CB40h

PXP_HW_PXP_DITHER_STORE_D_MASK3_H_CH0 field descriptions

Field	Description
D_MASK3_H_CH0	data mask3 high byte

42.11.163 PXP_HW_PXP_DITHER_STORE_D_MASK3_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + B50h offset = 21C_CB50h

PXP_HW_PXP_DITHER_STORE_D_MASK3_L_CH0 field descriptions

Field	Description
D_MASK3_L_CH0	data mask3 low byte

42.11.164 PXP_HW_PXP_DITHER_STORE_D_MASK4_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + B60h offset = 21C_CB60h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_DITHER_STORE_D_MASK4_L_CH0 field descriptions

Field	Description
D_MASK4_L_CH0	data mask4 low byte

42.11.166 PXP_HW_PXP_DITHER_STORE_D_MASK5_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + B80h offset = 21C_CB80h

PXP_HW_PXP_DITHER_STORE_D_MASK5_H_CH0 field descriptions

Field	Description
D_MASK5_H_CH0	data mask5 high byte

42.11.167 PXP_HW_PXP_DITHER_STORE_D_MASK5_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + B90h offset = 21C_CB90h

PXP_HW_PXP_DITHER_STORE_D_MASK5_L_CH0 field descriptions

Field	Description
D_MASK5_L_CH0	data mask5 low byte

42.11.168 PXP_HW_PXP_DITHER_STORE_D_MASK6_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + BA0h offset = 21C_CBA0h

PXP_HW_PXP_DITHER_STORE_D_MASK6_H_CH0 field descriptions

Field	Description
D_MASK6_H_CH0	data mask6 high byte

42.11.169 PXP_HW_PXP_DITHER_STORE_D_MASK6_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + BB0h offset = 21C_CBB0h

PXP_HW_PXP_DITHER_STORE_D_MASK6_L_CH0 field descriptions

Field	Description
D_MASK6_L_CH0	data mask6 low byte

42.11.170 PXP_HW_PXP_DITHER_STORE_D_MASK7_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + BC0h offset = 21C_CBC0h

PXP_HW_PXP_DITHER_STORE_D_MASK7_H_CH0 field descriptions

Field	Description
D_MASK7_H_CH0	data mask7 high byte

42.11.171 PXP_HW_PXP_DITHER_STORE_D_MASK7_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + BD0h offset = 21C_CBD0h

PXP_HW_PXP_DITHER_STORE_D_MASK7_L_CH0 field descriptions

Field	Description
D_MASK7_L_CH0	data mask7 low byte

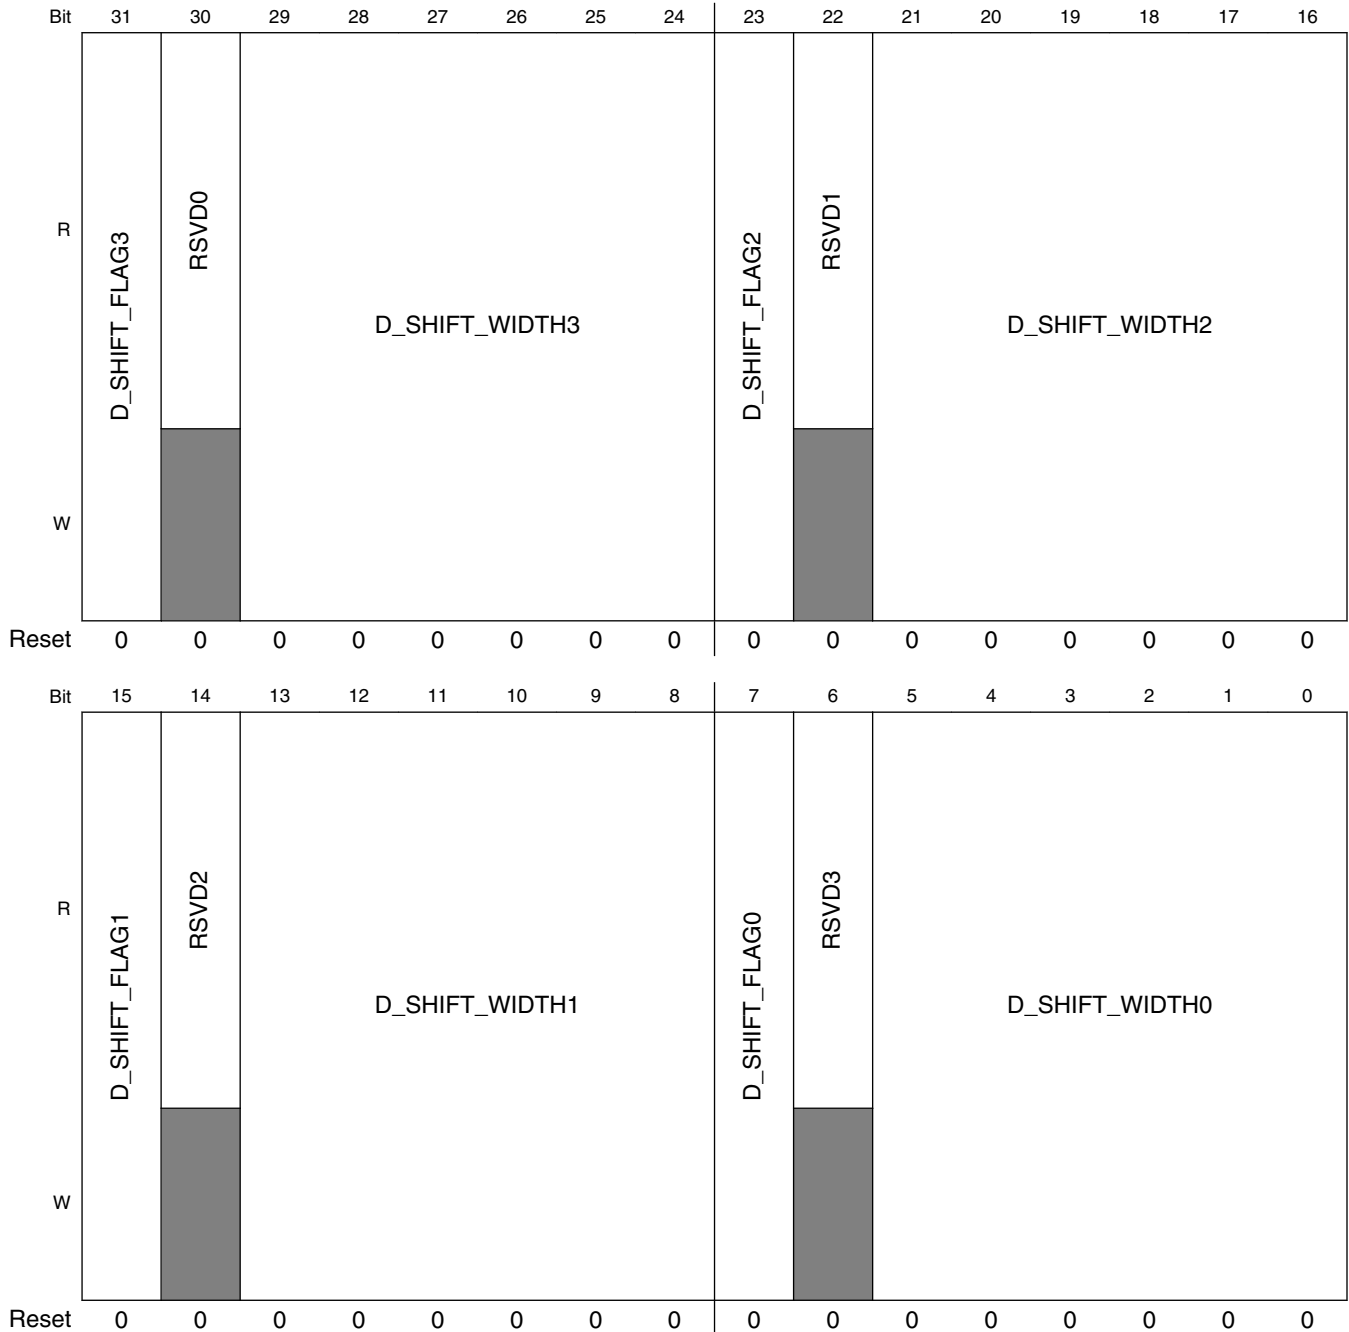

42.11.172 PXP_HW_PXP_DITHER_STORE_D_SHIFT_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + BE0h offset = 21C_CBE0h

PXP_HW_PXP_DITHER_STORE_D_SHIFT_L_CH0 field descriptions

Field	Description
31 D_SHIFT_FLAG3	data shift flag 3
30 RSVD0	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_DITHER_STORE_D_SHIFT_L_CH0 field descriptions (continued)

Field	Description
29–24 D_SHIFT_ WIDTH3	data shift width 3
23 D_SHIFT_FLAG2	data shift flag 2
22 RSVD1	Reserved, always set to zero.
21–16 D_SHIFT_ WIDTH2	data shift width 2
15 D_SHIFT_FLAG1	data shift flag 1
14 RSVD2	Reserved, always set to zero.
13–8 D_SHIFT_ WIDTH1	data shift width 1
7 D_SHIFT_FLAG0	data shift flag 0
6 RSVD3	Reserved, always set to zero.
D_SHIFT_ WIDTH0	data shift width 0

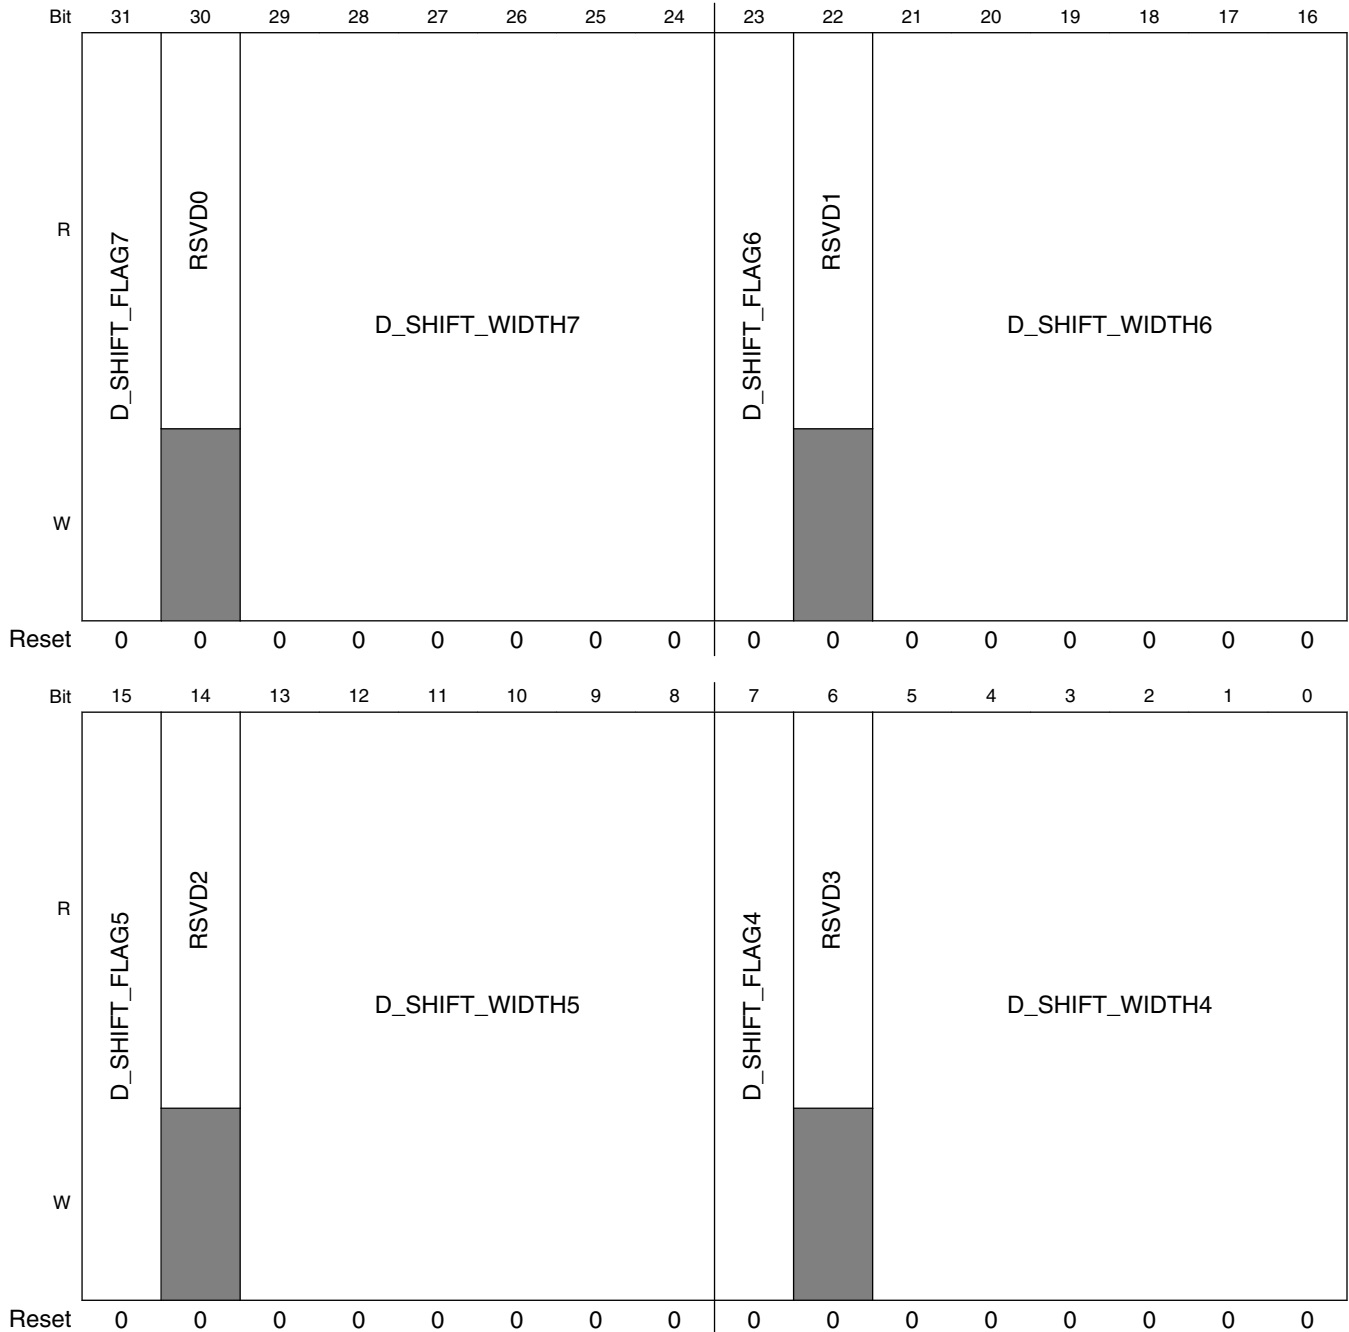

42.11.173 PXP_HW_PXP_DITHER_STORE_D_SHIFT_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + BF0h offset = 21C_CBF0h

PXP_HW_PXP_DITHER_STORE_D_SHIFT_H_CH0 field descriptions

Field	Description
31 D_SHIFT_FLAG7	data shift flag 7
30 RSVD0	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_DITHER_STORE_D_SHIFT_H_CH0 field descriptions (continued)

Field	Description
29–24 D_SHIFT_ WIDTH7	data shift width 3
23 D_SHIFT_FLAG6	data shift flag 6
22 RSVD1	Reserved, always set to zero.
21–16 D_SHIFT_ WIDTH6	data shift width 6
15 D_SHIFT_FLAG5	data shift flag 5
14 RSVD2	Reserved, always set to zero.
13–8 D_SHIFT_ WIDTH5	data shift width 5
7 D_SHIFT_FLAG4	data shift flag 4
6 RSVD3	Reserved, always set to zero.
D_SHIFT_ WIDTH4	data shift width 4

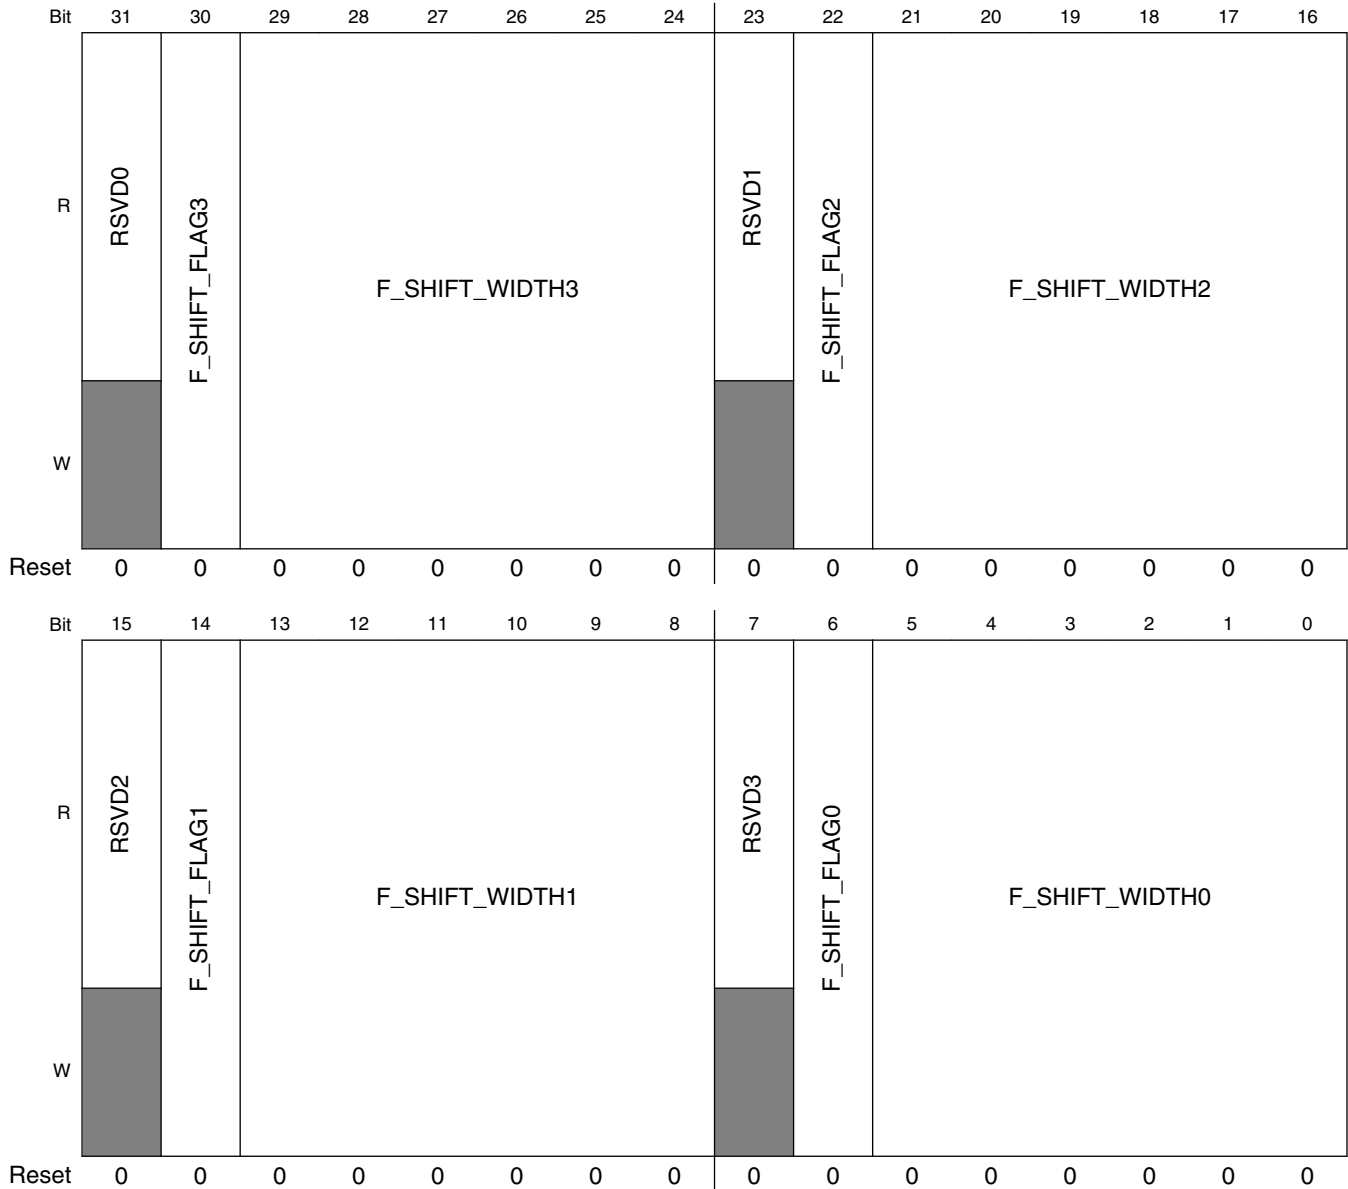

42.11.174 PXP_HW_PXP_DITHER_STORE_F_SHIFT_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + C00h offset = 21C_CC00h

PXP_HW_PXP_DITHER_STORE_F_SHIFT_L_CH0 field descriptions

Field	Description
31 RSVD0	Reserved, always set to zero.
30 F_SHIFT_FLAG3	flag shift flag3
29-24 F_SHIFT_WIDTH3	flag shift width 3
23 RSVD1	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_DITHER_STORE_F_SHIFT_L_CH0 field descriptions (continued)

Field	Description
22 F_SHIFT_FLAG2	flag shift flag2
21-16 F_SHIFT_WIDTH2	flag shift width 2
15 RSVD2	Reserved, always set to zero.
14 F_SHIFT_FLAG1	flag shift flag1
13-8 F_SHIFT_WIDTH1	flag shift width 1
7 RSVD3	Reserved, always set to zero.
6 F_SHIFT_FLAG0	flag shift flag0
F_SHIFT_WIDTH0	flag shift width 0

42.11.175 PXP_HW_PXP_DITHER_STORE_F_SHIFT_H_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + C10h offset = 21C_CC10h

PXP_HW_PXP_DITHER_STORE_F_SHIFT_H_CH0 field descriptions

Field	Description
31 RSVD0	Reserved, always set to zero.
30 F_SHIFT_FLAG7	flag shift flag7
29–24 F_SHIFT_WIDTH7	flag shift width 7
23 RSVD1	Reserved, always set to zero.
22 F_SHIFT_FLAG6	flag shift flag6
21–16 F_SHIFT_WIDTH6	flag shift width 5
15 RSVD2	Reserved, always set to zero.
14 F_SHIFT_FLAG5	flag shift flag5
13–8 F_SHIFT_WIDTH5	flag shift width 5
7 RSVD3	Reserved, always set to zero.
6 F_SHIFT_FLAG4	flag shift flag4
F_SHIFT_WIDTH4	flag shift width 4

42.11.176 PXP_HW_PXP_DITHER_STORE_F_MASK_L_CH0

This register defines the control bits for the pxp store_engine sub-block.

The Control register contains the control bits for the pxp store_engine sub-block.

EXAMPLE

Address: 21C_C000h base + C20h offset = 21C_CC20h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
31–24 F_MASK7	flag mask7

Table continues on the next page...

PXP_HW_PXP_DITHER_STORE_F_MASK_H_CH0 field descriptions (continued)

Field	Description
23–16 F_MASK6	flag mask6
15–8 F_MASK5	flag mask5
F_MASK4	flag mask4

42.11.178 Dither Control Register 0 (PXP_HW_PXP_DITHER_CTRL)

This register defines the control bits for the pxp dither sub-block.

HW_PXP_DITHER_CTRL: 0x1670

HW_PXP_DITHER_CTRL_SET: 0x1674

HW_PXP_DITHER_CTRL_CLR: 0x1678

HW_PXP_DITHER_CTRL_TOG: 0x167C

The Control register contains the primary controls for the PXP block.

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + 1670h offset = 21C_D670h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

PXP_HW_PXP_DITHER_CTRL field descriptions

Field	Description
31 BUSY0	When set indicates if the dither engine 0 is busy -- started but not finished processing all of the pixels in the current frame.
30 BUSY1	When set indicates if the dither engine 1 is busy -- started but not finished processing all of the pixels in the current frame.
29 BUSY2	When set indicates if the dither engine 2 is busy -- started but not finished processing all of the pixels in the current frame.
28-25 RSVD0	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_DITHER_CTRL field descriptions (continued)

Field	Description
24 ORDERED_ ROUND_MODE	For test purposes. In ordered mode only, this field specifies to use rounding or truncation when calculating the output pixel. 0x0 0 — Use truncation method. 0x1 1 — Use rounding method.
23 FINAL_LUT_ ENABLE	Enables a final stage register based LUT at the last stage before output. the lookup transform values come from register bits, not internal memory. Therefore they must be setup by the user by writing to the registers before processing. 0x0 Disabled — The dither engine 2 will not process any frames. 0x1 Enabled — The dither engine 2 is on and ready for processing
22–21 IDX_MATRIX2_ SIZE	For Dither Engine 2. Specify dimension (assumed square) of the index matrix in the LUT memory so proper indexing can occur. 0x0 0 — 4x4 0x1 1 — 8x8 0x2 2 — 16x16 0x3 3 — Input value of index
20–19 IDX_MATRIX1_ SIZE	For Dither Engine 1. Specify dimension (assumed square) of the index matrix in the LUT memory so proper indexing can occur. 0x0 0 — 4x4 0x1 1 — 8x8 0x2 2 — 16x16 0x3 3 — Input value of index
18–17 IDX_MATRIX0_ SIZE	For Dither Engine 0. Specify dimension (assumed square) of the index matrix in the LUT memory so proper indexing can occur. 0x0 0 — 4x4 0x1 1 — 8x8 0x2 2 — 16x16 0x3 3 — Input value of index
16–15 LUT_MODE	Specify to use memory lut to transform pixel. Lookup pre or post dithering cannot be used with Ordered dithering. This field only has reference to the internal memory based LUT function. There is a final stage LUT that is enabled through the FINAL_LUT_ENABLE field in this register. This final stage LUT can be enabled in any dither mode or LUT mode. 0x0 0 — LUT mode off. 0x1 1 — Use LUT at pre-dither stage. 0x2 2 — Use LUT at post-dither stage. 0x3 3 — Reserved`
14–12 NUM_QUANT_ BIT	Number of bits to quantize down to. From 8 to (0-7). 0x0 0 — Reserved. 0x1 1 — Quantize down to 1 bit. 0x2 2 — Quantize down to 2 bits. 0x3 3 — Quantize down to 3 bits. 0x4 4 — Quantize down to 4 bits. 0x5 5 — Quantize down to 5 bits.

Table continues on the next page...

PXP_HW_PXP_DITHER_CTRL field descriptions (continued)

Field	Description
	0x6 6 — Quantize down to 6 bits. 0x7 7 — Quantize down to 7 bits.
11–9 DITHER_MODE2	Dither mode. 0x0 0 — Pass through. 0x1 1 — Reserved. 0x2 2 — Reserved. 0x3 3 — Ordered. 0x4 4 — No Dithering, quantization only. 0x5 5 — Reserved. 0x6 6 — Reserved. 0x7 7 — Reserved.
8–6 DITHER_MODE1	Dither mode. 0x0 0 — Pass through. 0x1 1 — Reserved. 0x2 2 — Reserved. 0x3 3 — Ordered. 0x4 4 — No Dithering, quantization only. 0x5 5 — Reserved. 0x6 6 — Reserved. 0x7 7 — Reserved.
5–3 DITHER_MODE0	Dither mode. 0x0 0 — Pass through. 0x1 1 — Floyd-Steinberg. 0x2 2 — Atkinson. 0x3 3 — Ordered. 0x4 4 — No Dithering, quantization only. 0x5 5 — Reserved. 0x6 6 — Reserved. 0x7 7 — Reserved.
2 ENABLE2	Enables the dither engine 2 0x0 Disabled — The dither engine 2 will not process any frames. 0x1 Enabled — The dither engine 2 is on and ready for processing
1 ENABLE1	Enables the dither engine 1 0x0 Disabled — The dither engine 1 will not process any frames. 0x1 Enabled — The dither engine 1 is on and ready for processing
0 ENABLE0	Enables the dither engine 0 0x0 Disabled — The dither engine 0 will not process any frames. 0x1 Enabled — The dither engine 0 is on and ready for processing

42.11.179 Final stage lookup value Register (PXP_HW_PXP_DITHER_FINAL_LUT_DATA0)

8 bit data values for the final stage dither LUT.

HW_PXP_DITHER_FINAL_LUT_DATA0: 0x1680

HW_PXP_DITHER_FINAL_LUT_DATA0_SET: 0x1684

HW_PXP_DITHER_FINAL_LUT_DATA0_CLR: 0x1688

HW_PXP_DITHER_FINAL_LUT_DATA0_TOG: 0x168C

This register contains lookup data values for the final stage register based dither LUT.

EXAMPLE

Address: 21C_C000h base + 1680h offset = 21C_D680h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	DATA3								DATA2								DATA1								DATA0

PXP_HW_PXP_DITHER_FINAL_LUT_DATA0 field descriptions

Field	Description
31–24 DATA3	Final stage LUT data value.
23–16 DATA2	Final stage LUT data value.
15–8 DATA1	Final stage LUT data value.
DATA0	Final stage LUT data value.

42.11.180 Final stage lookup value Register (PXP_HW_PXP_DITHER_FINAL_LUT_DATA1)

8 bit data values for the final stage dither LUT.

HW_PXP_DITHER_FINAL_LUT_DATA1: 0x1690

HW_PXP_DITHER_FINAL_LUT_DATA1_SET: 0x1694

HW_PXP_DITHER_FINAL_LUT_DATA1_CLR: 0x1698

HW_PXP_DITHER_FINAL_LUT_DATA1_TOG: 0x169C

This register contains lookup data values for the final stage register based dither LUT.

EXAMPLE

Address: 21C_C000h base + 1690h offset = 21C_D690h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_DITHER_FINAL_LUT_DATA1 field descriptions

Field	Description
31–24 DATA7	Final stage LUT data value.
23–16 DATA6	Final stage LUT data value.
15–8 DATA5	Final stage LUT data value.
DATA4	Final stage LUT data value.

42.11.181 Final stage lookup value Register (PXP_HW_PXP_DITHER_FINAL_LUT_DATA2)

8 bit data values for the final stage dither LUT.

HW_PXP_DITHER_FINAL_LUT_DATA2: 0x16A0

HW_PXP_DITHER_FINAL_LUT_DATA2_SET: 0x16A4

HW_PXP_DITHER_FINAL_LUT_DATA2_CLR: 0x16A8

HW_PXP_DITHER_FINAL_LUT_DATA2_TOG: 0x16AC

This register contains lookup data values for the final stage register based dither LUT.

EXAMPLE

Address: 21C_C000h base + 16A0h offset = 21C_D6A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_DITHER_FINAL_LUT_DATA2 field descriptions

Field	Description
31–24 DATA11	Final stage LUT data value.
23–16 DATA10	Final stage LUT data value.
15–8 DATA9	Final stage LUT data value.
DATA8	Final stage LUT data value.

**42.11.182 Final stage lookup value Register
(PXP_HW_PXP_DITHER_FINAL_LUT_DATA3)**

8 bit data values for the final stage dither LUT.

HW_PXP_DITHER_FINAL_LUT_DATA3: 0x16B0

HW_PXP_DITHER_FINAL_LUT_DATA3_SET: 0x16B4

HW_PXP_DITHER_FINAL_LUT_DATA3_CLR: 0x16B8

HW_PXP_DITHER_FINAL_LUT_DATA3_TOG: 0x16BC

This register contains lookup data values for the final stage register based dither LUT.

EXAMPLE

Address: 21C_C000h base + 16B0h offset = 21C_D6B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
R	DATA15								DATA14								DATA13								DATA12

PXP_HW_PXP_DITHER_FINAL_LUT_DATA3 field descriptions

Field	Description
31–24 DATA15	Final stage LUT data value.
23–16 DATA14	Final stage LUT data value.
15–8 DATA13	Final stage LUT data value.
DATA12	Final stage LUT data value.

42.11.183 Histogram Control Register. (PXP_HW_PXP_HIST_A_CTRL)

Provides control and status registers for the PXP's histogram classification algorithm.

Address: 21C_C000h base + 2A00h offset = 21C_EA00h

PXP_HW_PXP_HIST_A_CTRL field descriptions

Field	Description
31–27 RSVD4	Reserved, always set to zero.
26–24 PIXEL_WIDTH	The width of the pixel to be used for histogram calculation
23 RSVD3	Reserved, always set to zero.
22–16 PIXEL_OFFSET	The offset of the pixel to be used for histogram calculation
15–13 RSVD2	Reserved, always set to zero.

Table continues on the next page...

PXP_HW_PXP_HIST_A_CTRL field descriptions (continued)

Field	Description
12–8 STATUS	Indicates which histogram matched the processed bitmap. Bit[0] indicates that the bitmap pixels were fully contained within the HIST2 (black / white) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST32 (5-bit grayscale) histogram.
7–5 RSVD1	Reserved, always set to zero.
4 CLEAR	Write 1 to clear the histogram result and will be self-clear after clear function finished
3–1 RSVD0	Reserved, always set to zero.
0 ENABLE	Enable the Histogram Engine

42.11.184 Histogram Pixel Mask Register. (PXP_HW_PXP_HIST_A_MASK)

Provides control registers for the pixel masking in PXP's histogram.

Address: 21C_C000h base + 2A10h offset = 21C_EA10h

PXP_HW_PXP_HIST_A_MASK field descriptions

Field	Description
31–24 MASK_VALUE1	The value1 for mask condition checking
23–16 MASK_VALUE0	The value0 for mask condition checking
15–13 MASK_WIDTH	The width of the field to be checked against mask condition
12–6 MASK_OFFSET	The offset of the field to be checked against mask condition
5–4 MASK_MODE	Operation mode of pixel mask function 0x0 EQUAL — Run histogram for pixels equal to value0 0x1 NOT_EQUAL — Run histogram for pixels not equal to value0 0x2 INSIDE — Run histogram for pixels within the range of value0 to value1 0x3 OUTSIDE — Run histogram for pixels outside of the rang of value0 to value1
3–1 RSVD0	Reserved, always set to zero.
0 MASK_EN	Enable the Pixel Mask Function in Histogram

**42.11.185 Histogram Pixel Buffer Size Register.
(PXP_HW_PXP_HIST_A_BUF_SIZE)**

This register defines the size of the buffer to be processed by the histogram engine.

Address: 21C_C000h base + 2A20h offset = 21C_EA20h

PXP_HW_PXP_HIST_A_BUF_SIZE field descriptions

Field	Description
31–28 RSVD0	Reserved. This field always reads 0.
27–16 HEIGHT	This indicate the buffer height in pixels
15–12 RSVD1	Reserved. This field always reads 0.
WIDTH	This indicate the buffer width in pixels

42.11.186 Total Number of Pixels Used by Histogram Engine. (PXP_HW_PXP_HIST_A_TOTAL_PIXEL)

This register shows the total number of pixels used by histogram engine

Address: 21C_C000h base + 2A30h offset = 21C_EA30h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0								TOTAL_PIXEL																							
W	[Greyed out]																[Greyed out]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_HIST_A_TOTAL_PIXEL field descriptions

Field	Description
31–24 RSVD0	Reserved. This field always reads 0.
TOTAL_PIXEL	Total number of pixels used by histogram engine, the pixels got masked will be skipped

42.11.187 The X Coordinate Offset for Active Area. (PXP_HW_PXP_HIST_A_ACTIVE_AREA_X)

This register shows the minimal and maximum X coordinate offset for the active area in histogram processing

Address: 21C_C000h base + 2A40h offset = 21C_EA40h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_HIST_A_ACTIVE_AREA_X field descriptions

Field	Description
31–28 RSVD1	Reserved. This field always reads 0.
27–16 MAX_X_OFFSET	Maximum X coordinate offset for the active area in histogram processing
15–12 RSVD0	Reserved. This field always reads 0.
MIN_X_OFFSET	Minimal X coordinate offset for the active area in histogram processing

42.11.188 The Y Coordinate Offset for Active Area. (PXP_HW_PXP_HIST_A_ACTIVE_AREA_Y)

This register shows the minimal and maximum Y coordinate offset for the active area in histogram processing

Address: 21C_C000h base + 2A50h offset = 21C_EA50h

PXP_HW_PXP_HIST_A_ACTIVE_AREA_Y field descriptions

Field	Description
31–28 RSVD1	Reserved. This field always reads 0.
27–16 MAX_Y_OFFSET	Maximum Y coordinate offset for the active area in histogram processing
15–12 RSVD0	Reserved. This field always reads 0.
MIN_Y_OFFSET	Minimal Y coordinate offset for the active area in histogram processing

42.11.189 Histogram Result Based on RAW Pixel Value. (PXP_HW_PXP_HIST_A_RAW_STAT0)

This register shows the lower 32-bit of the histogram result based on raw pixel value

Address: 21C_C000h base + 2A60h offset = 21C_EA60h

PXP_HW_PXP_HIST_A_RAW_STAT0 field descriptions

Field	Description
STAT0	Lower 32-bit result fo the histogram calculation

42.11.190 Histogram Result Based on RAW Pixel Value. (PXP_HW_PXP_HIST_A_RAW_STAT1)

This register shows the higher 32-bit of the histogram result based on raw pixel value

Address: 21C_C000h base + 2A70h offset = 21C_EA70h

PXP_HW_PXP_HIST_A_RAW_STAT1 field descriptions

Field	Description
STAT1	Higher 32-bit result for the histogram calculation

42.11.191 Histogram Control Register. (PXP_HW_PXP_HIST_B_CTRL)

Provides control and status registers for the PXP's histogram classification algorithm.

Address: 21C_C000h base + 2A80h offset = 21C_EA80h

PXP Memory Map/Register Definition

PXP_HW_PXP_HIST_B_CTRL field descriptions

Field	Description
31–27 RSVD4	Reserved, always set to zero.
26–24 PIXEL_WIDTH	The width of the pixel to be used for histogram calculation
23 RSVD3	Reserved, always set to zero.
22–16 PIXEL_OFFSET	The offset of the pixel to be used for histogram calculation
15–13 RSVD2	Reserved, always set to zero.
12–8 STATUS	Indicates which histogram matched the processed bitmap. Bit[0] indicates that the bitmap pixels were fully contained within the HIST2 (black / white) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST32 (5-bit grayscale) histogram.
7–5 RSVD1	Reserved, always set to zero.
4 CLEAR	Write 1 to clear the histogram result and will be self-clear after clear function finished
3–1 RSVD0	Reserved, always set to zero.
0 ENABLE	Enable the Histogram Engine

42.11.192 Histogram Pixel Mask Register. (PXP_HW_PXP_HIST_B_MASK)

Provides control registers for the pixel masking in PXP's histogram.

Address: 21C_C000h base + 2A90h offset = 21C_EA90h

PXP_HW_PXP_HIST_B_MASK field descriptions

Field	Description
31–24 MASK_VALUE1	The value1 for mask condition checking
23–16 MASK_VALUE0	The value0 for mask condition checking
15–13 MASK_WIDTH	The width of the field to be checked against mask condition
12–6 MASK_OFFSET	The offset of the field to be checked against mask condition
5–4 MASK_MODE	Operation mode of pixel mask function 0x0 EQUAL — Run histogram for pixels equal to value0 0x1 NOT_EQUAL — Run histogram for pixels not equal to value0 0x2 INSIDE — Run histogram for pixels within the range of value0 to value1 0x3 OUTSIDE — Run histogram for pixels outside of the rang of value0 to value1
3–1 RSVD0	Reserved, always set to zero.
0 MASK_EN	Enable the Pixel Mask Function in Histogram

42.11.193 Histogram Pixel Buffer Size Register. (PXP_HW_PXP_HIST_B_BUF_SIZE)

This register defines the size of the buffer to be processed by the histogram engine.

Address: 21C_C000h base + 2AA0h offset = 21C_EAA0h

PXP_HW_PXP_HIST_B_BUF_SIZE field descriptions

Field	Description
31–28 RSVD0	Reserved. This field always reads 0.
27–16 HEIGHT	This indicate the buffer height in pixels
15–12 RSVD1	Reserved. This field always reads 0.
WIDTH	This indicate the buffer width in pixels

42.11.194 Total Number of Pixels Used by Histogram Engine. (PXP_HW_PXP_HIST_B_TOTAL_PIXEL)

This register shows the total number of pixels used by histogram engine

Address: 21C_C000h base + 2AB0h offset = 21C_EAB0h

PXP_HW_PXP_HIST_B_TOTAL_PIXEL field descriptions

Field	Description
31–24 RSVD0	Reserved. This field always reads 0.
TOTAL_PIXEL	Total number of pixels used by histogram engine, the pixels got masked will be skipped

42.11.195 The X Coordinate Offset for Active Area. (PXP_HW_PXP_HIST_B_ACTIVE_AREA_X)

This register shows the minimal and maximum X coordinate offset for the active area in histogram processing

Address: 21C_C000h base + 2AC0h offset = 21C_EAC0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_HIST_B_ACTIVE_AREA_Y field descriptions

Field	Description
31–28 RSVD1	Reserved. This field always reads 0.

Table continues on the next page...

PXP_HW_PXP_HIST_B_ACTIVE_AREA_Y field descriptions (continued)

Field	Description
27-16 MAX_Y_OFFSET	Maximum Y coordinate offset for the active area in histogram processing
15-12 RSVD0	Reserved. This field always reads 0.
MIN_Y_OFFSET	Minimul Y coordinate offset for the active area in histogram processing

**42.11.197 Histogram Result Based on RAW Pixel Value.
(PXP_HW_PXP_HIST_B_RAW_STAT0)**

This register shows the lower 32-bit of the histogram result based on raw pixel value

Address: 21C_C000h base + 2AE0h offset = 21C_EAE0h

PXP_HW_PXP_HIST_B_RAW_STAT0 field descriptions

Field	Description
STAT0	Lower 32-bit result fo the histogram calculation

**42.11.198 Histogram Result Based on RAW Pixel Value.
(PXP_HW_PXP_HIST_B_RAW_STAT1)**

This register shows the higher 32-bit of the histogram result based on raw pixel value

Address: 21C_C000h base + 2AF0h offset = 21C_EAF0h

PXP_HW_PXP_HIST_B_RAW_STAT1 field descriptions

Field	Description
STAT1	Higher 32-bit result fo the histogram calculation

42.11.199 2-level Histogram Parameter Register. (PXP_HW_PXP_HIST2_PARAM)

This register specifies the valid values for a 2-level histogram. If all pixels in a bitmap match the 2-level histogram values, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL_MODE control field.

Address: 21C_C000h base + 2B00h offset = 21C_EB00h

Field	Description
29–24 VALUE3	GRAY3 value for 16-level histogram
23–22 RSVD2	Reserved, always set to zero.
21–16 VALUE2	GRAY2 value for 16-level histogram
15–14 RSVD1	Reserved, always set to zero.
13–8 VALUE1	GRAY1 value for 16-level histogram
7–6 RSVD0	Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 16-level histogram

**42.11.204 16-level Histogram Parameter 1 Register.
(PXP_HW_PXP_HIST16_PARAM1)**

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match the 16-level histogram values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL_MODE control field.

Address: 21C_C000h base + 2B50h offset = 21C_EB50h

42.11.215 PXP_HW_PXP_COMP_CTRL

This register defines the control bits for the pxp compression sub-block.

HW_PXP_COMP_CTRL: 0x2C00

PXP Memory Map/Register Definition

HW_PXP_COMP_CTRL_SET: 0x2C04

HW_PXP_COMP_CTRL_CLR: 0x2C08

HW_PXP_COMP_CTRL_TOG: 0x2C0C

EXAMPLE

Address: 21C_C000h base + 2C00h offset = 21C_EC00h

PXP_HW_PXP_COMP_CTRL field descriptions

Field	Description
31–9 RSVD0	Reserved. This field always reads 0.
8 SW_RESET	Write to 1 to do a software reset to the engine, self-clear.
7–1 RSVD1	Reserved. This field always reads 0.
0 START	Write to 1 to start operation, self-clear

42.11.216 PXP_HW_PXP_COMP_FORMAT0

This register defines the format bits for the pxp compression sub-block.

HW_PXP_COMP_FORMAT0: 0x2C10

HW_PXP_COMP_FORMAT0_SET: 0x2C14

HW_PXP_COMP_FORMAT0_CLR: 0x2C18

HW_PXP_COMP_FORMAT0_TOG: 0x2C1C

EXAMPLE

Address: 21C_C000h base + 2C10h offset = 21C_EC10h

PXP_HW_PXP_COMP_FORMAT0 field descriptions

Field	Description
31–28 RSVD0	Reserved. This field always reads 0.
27 FIFOFULL	step1 write fifo full

Table continues on the next page...

PXP_HW_PXP_COMP_FORMAT0 field descriptions (continued)

Field	Description
26 ERR_PRONE	step1 write fifo full. If detected, this bit is 1, there is data error in current frame.
25-16 PIXEL_PITCH_64B	extend each line to be 64-bit aligned
15-10 RSVD1	Reserved. This field always reads 0.
9-8 MASK_INDEX	which field is the mask,0 for A, 3 for D
7-6 RSVD2	Reserved. This field always reads 0.
5-4 FIELD_NUM	indicate how many fields in one pixel,0 for only A;3 for ABCD
3-1 RSVD3	Reserved. This field always reads 0.
0 FLAG_32B	1 indicate 32-bit for one pixel, 0 for 16-bit

42.11.217 PXP_HW_PXP_COMP_FORMAT1

This register defines the format bits for the pxp compression sub-block.

EXAMPLE

Address: 21C_C000h base + 2C20h offset = 21C_EC20h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	D_LEN	D_OFFSET				C_LEN				C_OFFSET				B_LEN				B_OFFSET				A_LEN				A_OFFSET						
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

PXP_HW_PXP_COMP_FORMAT1 field descriptions

Field	Description
31-29 D_LEN	length of field D, 0 for 1 byte, 7 for 8 bytes, length of the field plus the length of RLE(*_runlen) should not more than 16-bit
28-24 D_OFFSET	offset for field D, 0 means D start from bit0
23-21 C_LEN	length of field C, 0 for 1 byte, 7 for 8 bytes, length of the field plus the length of RLE(*_runlen) should not more than 16-bit
20-16 C_OFFSET	offset for field C, 0 means C start from bit0
15-13 B_LEN	length of field B, 0 for 1 byte, 7 for 8 bytes, length of the field plus the length of RLE(*_runlen) should not more than 16-bit

Table continues on the next page...

PXP_HW_PXP_COMP_FORMAT1 field descriptions (continued)

Field	Description
12–8 B_OFFSET	offset for field B, 0 means B start from bit0
7–5 A_LEN	length of field A, 0 for 1 byte, 7 for 8 bytes, length of the field plus the length of RLE(*_runlen) should not more than 16-bit
A_OFFSET	offset for field A, 0 means A start from bit0

42.11.218 PXP_HW_PXP_COMP_FORMAT2

This register defines the format bits for the pxp compression sub-block.

EXAMPLE

Address: 21C_C000h base + 2C30h offset = 21C_EC30h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_COMP_FORMAT2 field descriptions

Field	Description
31–16 RSVD	Reserved. This field always reads 0.
15–12 D_RUNLEN	length of the RLE for field D, 12-bit(4095) max
11–8 C_RUNLEN	length of the RLE for field C, 12-bit(4095) max
7–4 B_RUNLEN	length of the RLE for field B, 12-bit(4095) max
A_RUNLEN	length of the RLE for field A, 12-bit(4095) max

42.11.219 PXP_HW_PXP_COMP_MASK0

This register defines the format bits for the pxp compress mask configure.

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + 2C40h offset = 21C_EC40h

PXP_HW_PXP_COMP_MASK0 field descriptions

Field	Description
VLD_MASK_LOW	low 32bit of the valid mask, one of ABCD will be vld_flag, 1 left shifted by vld_flag anded with vld_mask will be used to check whether this pixel is valid

42.11.220 PXP_HW_PXP_COMP_MASK1

This register defines the format bits for the pxp compress mask configure.

EXAMPLE

Address: 21C_C000h base + 2C50h offset = 21C_EC50h

PXP_HW_PXP_COMP_MASK1 field descriptions

Field	Description
VLD_MASK_HIGH	high 32bit of the valid mask

42.11.221 PXP_HW_PXP_COMP_BUFFER_SIZE

This register defines the format bits for the pxp compress mask configure.

EXAMPLE

Address: 21C_C000h base + 2C60h offset = 21C_EC60h

PXP_HW_PXP_COMP_BUFFER_SIZE field descriptions

Field	Description
31–29 RSVD0	Reserved. This field always reads 0.
28–16 PIXEL_WIDTH	pixel width of the input frame, 4096 max
15–13 RSVD1	Reserved. This field always reads 0.
PIXEL_LENGTH	pixel length of the input frame, 4096 max

42.11.222 PXP_HW_PXP_COMP_SOURCE

This register defines the pxp compress source buffer address register.

EXAMPLE

Address: 21C_C000h base + 2C70h offset = 21C_EC70h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_COMP_SOURCE field descriptions

Field	Description
SOURCE_ADDR	source address of the input frame that located in the memory, should be 32-byte aligned

42.11.223 PXP_HW_PXP_COMP_TARGET

This register defines the pxp compress target buffer address register.

EXAMPLE

Address: 21C_C000h base + 2C80h offset = 21C_EC80h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_HW_PXP_COMP_TARGET field descriptions

Field	Description
TARGET_ADDR	target address of the output frame that the pxp compress engine should write to the memory, should be 32-byte aligned

42.11.224 PXP_HW_PXP_COMP_BUFFER_A

This register defines the pxp compress field A buffer address register.

EXAMPLE

Address: 21C_C000h base + 2C90h offset = 21C_EC90h

PXP_HW_PXP_COMP_BUFFER_A field descriptions

Field	Description
A_SRAM_ADDR	sram address used for inter-data saving of A filed,should be 32-bit aligned, SW should make sure the SRAM addr for 4 field will not overlap

42.11.225 PXP_HW_PXP_COMP_BUFFER_B

This register defines the pxp compress field B buffer address register.

EXAMPLE

Address: 21C_C000h base + 2CA0h offset = 21C_ECA0h

PXP_HW_PXP_COMP_BUFFER_B field descriptions

Field	Description
B_SRAM_ADDR	sram address used for inter-data saving of B filed,should be 32-bit aligned, SW should make sure the SRAM addr for 4 field will not overlap

42.11.226 PXP_HW_PXP_COMP_BUFFER_C

This register defines the pxp compress field C buffer address register.

EXAMPLE

Address: 21C_C000h base + 2CB0h offset = 21C_ECB0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_COMP_BUFFER_C field descriptions

Field	Description
C_SRAM_ADDR	sram address used for inter-data saving of C filed,should be 32-bit aligned, SW should make sure the SRAM addr for 4 field will not overlap

42.11.227 PXP_HW_PXP_COMP_BUFFER_D

This register defines the pxp compress field D buffer address register.

EXAMPLE

Address: 21C_C000h base + 2CC0h offset = 21C_ECC0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_HW_PXP_COMP_BUFFER_D field descriptions

Field	Description
D_SRAM_ADDR	sram address used for inter-data saving of D filed,should be 32-bit aligned, SW should make sure the SRAM addr for 4 field will not overlap

42.11.228 PXP_HW_PXP_COMP_DEBUG

This register defines the pxp compress debug register.

EXAMPLE

PXP Memory Map/Register Definition

Address: 21C_C000h base + 2CD0h offset = 21C_ECD0h

PXP_HW_PXP_COMP_DEBUG field descriptions

Field	Description
31–8 DEBUG_VALUE	value of selected debug signal
DEBUG_SEL	debug selection

42.11.229 PXP_HW_PXP_BUS_MUX

This register defines the pxp subblock bus mux on top level.

EXAMPLE

Address: 21C_C000h base + 2CE0h offset = 21C_ECE0h

PXP_HW_PXP_BUS_MUX field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
23–16 WR_SEL	Subblock BUS to AXI MUX, setting 0 to axi0 and setting 1 to axi1
15–8 RSVD0	Reserved, always set to zero.
RD_SEL	Subblock BUS to AXI MUX, setting 0 to axi0 and setting 1 to axi1

42.11.230 PXP_HW_PXP_HANDSHAKE_READY_MUX0

This register defines the pxp subblock handshake signals ready mux on top level.

EXAMPLE

Address: 21C_C000h base + 2CF0h offset = 21C_ECF0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

7–4 HSK9	Subblock double buffer handshake signals MUX
HSK8	Subblock double buffer handshake signals MUX

42.11.234 PXP_HW_PXP_HANDSHAKE_CPU_FETCH

This register defines the pxp software handshake signals with CPU.

HW_PXP_HANDSHAKE_CPU_FETCH: 0x2D30

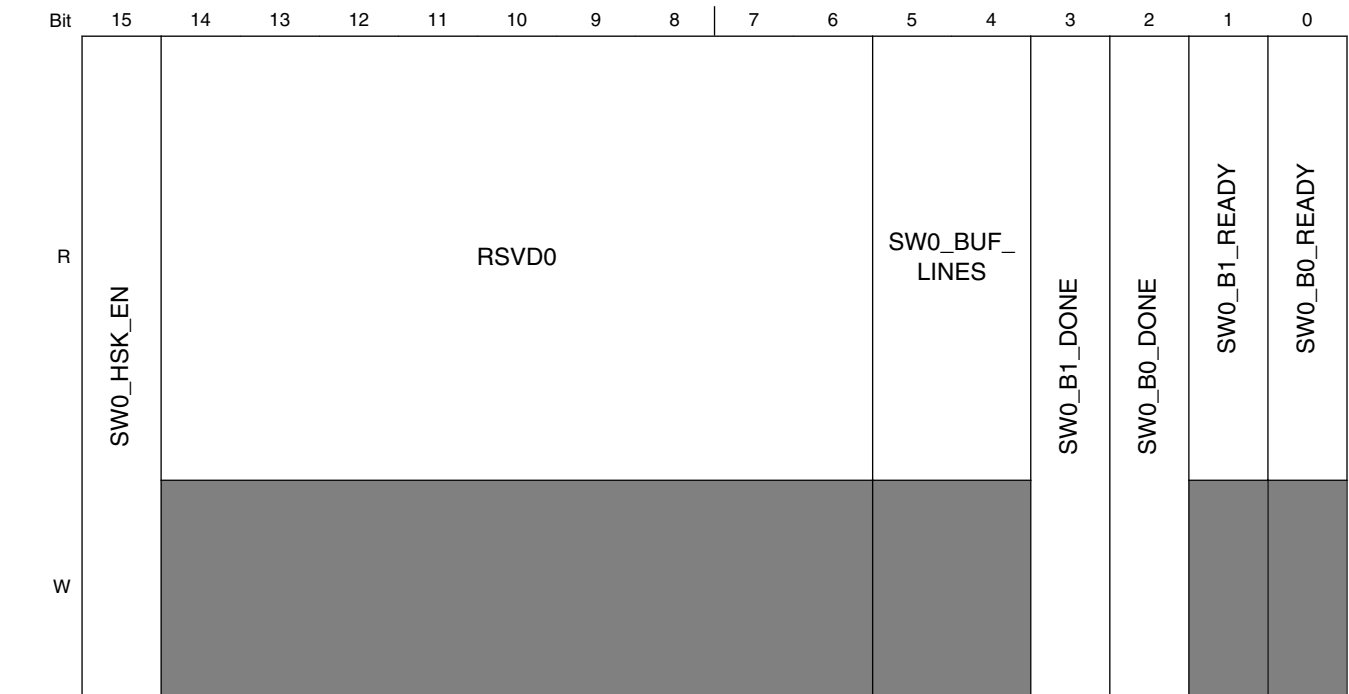

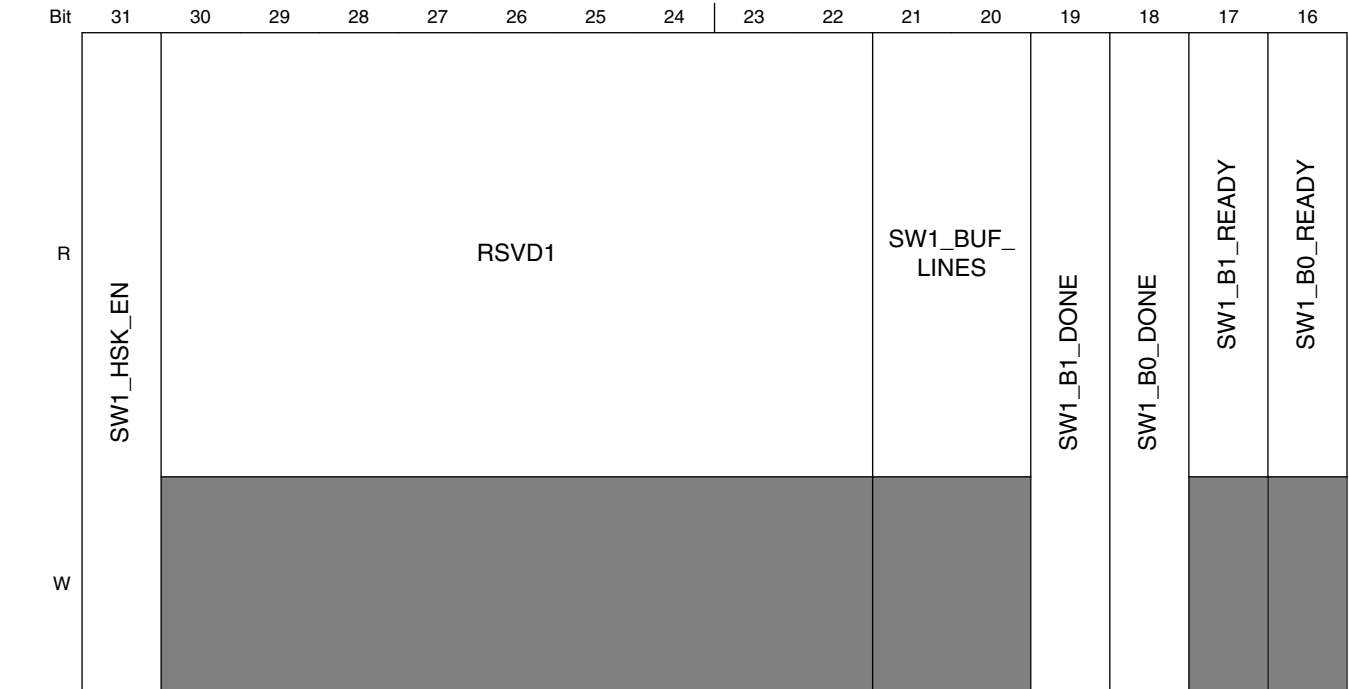

HW_PXP_HANDSHAKE_CPU_FETCH_SET: 0x2D34

HW_PXP_HANDSHAKE_CPU_FETCH_CLR: 0x2D38

HW_PXP_HANDSHAKE_CPU_FETCH_TOG: 0x2D3C

EXAMPLE

Address: 21C_C000h base + 2D30h offset = 21C_ED30h

PXP_HW_PXP_HANDSHAKE_CPU_FETCH field descriptions

Field	Description
31 SW1_HSK_EN	Enable software handshake 1 with CPU

Table continues on the next page...

PXP_HW_PXP_HANDSHAKE_CPU_FETCH field descriptions (continued)

Field	Description
30–22 RSVD1	Reserved, always set to zero.
21–20 SW1_BUF_ LINES	Buffer lines for software handshake 0x0 LINE_4 — Buffer lines is 4 lines. 0x1 LINE_8 — Buffer lines is 8 lines. 0x2 LINE_16 — Buffer lines is 16 lines.
19 SW1_B1_DONE	CPU b1 buffer done to PXP
18 SW1_B0_DONE	CPU b0 buffer done to PXP
17 SW1_B1_ READY	PXP b1 buffer ready to CPU
16 SW1_B0_ READY	PXP b0 buffer ready to CPU
15 SW0_HSK_EN	Enable software handshake 0 with CPU
14–6 RSVD0	Reserved, always set to zero.
5–4 SW0_BUF_ LINES	Buffer lines for software handshake 0x0 LINE_4 — Buffer lines is 4 lines. 0x1 LINE_8 — Buffer lines is 8 lines. 0x2 LINE_16 — Buffer lines is 16 lines.
3 SW0_B1_DONE	CPU b1 buffer done to PXP
2 SW0_B0_DONE	CPU b0 buffer done to PXP
1 SW0_B1_ READY	PXP b1 buffer ready to CPU
0 SW0_B0_ READY	PXP b0 buffer ready to CPU

42.11.235 PXP_HW_PXP_HANDSHAKE_CPU_STORE

This register defines the pxp software handshake signals with CPU.

HW_PXP_HANDSHAKE_CPU_STORE: 0x2D40

HW_PXP_HANDSHAKE_CPU_STORE_SET: 0x2D44

HW_PXP_HANDSHAKE_CPU_STORE_CLR: 0x2D48

HW_PXP_HANDSHAKE_CPU_STORE_TOG: 0x2D4C

EXAMPLE

Address: 21C_C000h base + 2D40h offset = 21C_ED40h

PXP_HW_PXP_HANDSHAKE_CPU_STORE field descriptions

Field	Description
31 SW1_HSK_EN	Enable software handshake 1 with CPU
30–22 RSVD1	Reserved, always set to zero.
21–20 SW1_BUF_LINES	Buffer lines for software handshake 0x0 LINE_4 — Buffer lines is 4 lines. 0x1 LINE_8 — Buffer lines is 8 lines. 0x2 LINE_16 — Buffer lines is 16 lines.
19 SW1_B1_DONE	CPU b1 buffer done to PXP
18 SW1_B0_DONE	CPU b0 buffer done to PXP
17 SW1_B1_READY	PXP b1 buffer ready to CPU
16 SW1_B0_READY	PXP b0 buffer ready to CPU
15 SW0_HSK_EN	Enable software handshake 0 with CPU
14–6 RSVD0	Reserved, always set to zero.
5–4 SW0_BUF_LINES	Buffer lines for software handshake 0x0 LINE_4 — Buffer lines is 4 lines. 0x1 LINE_8 — Buffer lines is 8 lines. 0x2 LINE_16 — Buffer lines is 16 lines.
3 SW0_B1_DONE	CPU b1 buffer done to PXP
2 SW0_B0_DONE	CPU b0 buffer done to PXP
1 SW0_B1_READY	PXP b1 buffer ready to CPU
0 SW0_B0_READY	PXP b0 buffer ready to CPU

Chapter 43

Quad Serial Peripheral Interface (QuadSPI)

43.1 Overview

The Quad Serial Peripheral Interface (QuadSPI) block acts as an interface to one or two external serial flash devices, each with up to four bidirectional data lines. The following figure is a block diagram of the QuadSPI module.

Figure 43-1. QuadSPI Block Diagram

The following figure describes the serial flash clock diagram in QuadSPI:

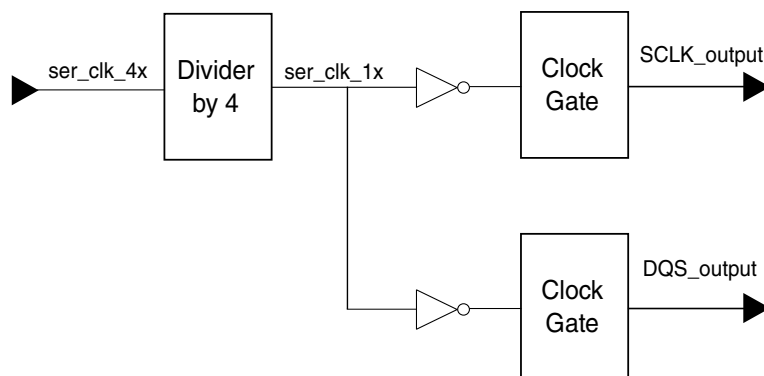

Figure 43-2. Flash Clock Diagram

ser_clk_4x is the serial clock root from CCM

ser_clk_1x' is generated clock from 'ser_clk_4x' divided by 4

SCLK_output is serial output clock generated from 'ser_clk_1x' with inverter and clock gate, it's used as Clock by external serial flash device.

DQS_output is serial flash data strobe signal generated from 'ser_clk_1x' with inverter and clock gate. This signal could be loopback from pad and used as sampling clock for serial flash data.

43.1.1 Features

The QuadSPI supports the following features:

- Flexible sequence engine to support various flash vendor devices.
- Single, dual, quad mode of operation.
- DDR/DTR mode wherein the data is generated on every edge of the serial flash clock.
- Support for flash data strobe signal for data sampling in DDR and SDR mode.
- Two identical serial flash devices can be connected and accessed in parallel for data read operations, forming one (virtual) flash memory with doubled readout bandwidth.
- DMA support to read RX Buffer data via AMBA AHB bus (64-bit width interface) or IP registers space (32-bit access).
 - Inner loop size of DMA access can be configured.
- Multi master accesses with priority

- Flexible and configurable buffer for each master
- Thirteen interrupt conditions (see [Table 43-10](#))
- Memory mapped read access to connected flash devices.
- Programmable sequence engine to cater to future command/protocol changes and able to support all existing vendor commands and operations.
 - Supports 3-byte and 4-byte addressing.
 - TXFIFO size is 512Byte
 - RXFIFO size is 128Byte
 - AHB BUF size is 1KByte

43.1.2 QuadSPI Modes of Operation

This section provides information about the modes in which the QuadSPI module can be used.

43.1.2.1 Normal Mode

In this mode, one or two external serial flash memory devices can be accessed. Further details about this mode of operation can be found in [Modes of Operation \(Normal Mode\)](#).

43.1.2.2 Module Disable Mode

This mode is used for power management of the device containing the QuadSPI module. It is controlled by signals external to the QuadSPI. The clock to the non-memory mapped logic in the QuadSPI can be stopped while in Module Disable Mode.

43.1.3 Acronyms and Abbreviations

The following table contains acronyms and abbreviations used in this document.

Table 43-1. Acronyms and Abbreviations

Terms	Description
AHB	Advanced High-performance Bus, version of AMBA
AMBA	Advanced Microcontroller Bus Architecture

Table continues on the next page...

Table 43-1. Acronyms and Abbreviations (continued)

Terms	Description
BE	Big Endian Byte Ordering
CS	Chip Select
DMA	Direct Memory Access
MB	Megabyte. Each MB is 1024 * 1024 bytes
IFM	Individual Flash Mode
PFM	Parallel Flash Mode
LSB	Least Significant Bit
MSB	Most Significant Bit
PCS	Peripheral Chip Select
QSPI, QuadSPI	Quad Serial Peripheral Interface
SCK	Serial Communications Clock
w1c	Write 1 to clear, writing a 1 to this field resets the flag

43.1.4 Glossary for QuadSPI module

Table 43-2. Glossary

Term	Definition
AHB Command	An AHB Command is a SFM Command triggered by a read access to the address range belonging to the memory mapped access defined in Table 43-7 . Refer to AHB Commands for details.
Asserted	A signal that is asserted is in its active state. An active low signal changes from logic level one to logic level zero when asserted, and an active high signal changes from logic level zero to logic level one.
Clear	To clear a bit or bits means to establish logic level zero on the bit or bits.
Clock Phase	Determines when the data should be sampled relative to the active edge of SCK
Clock Polarity	Determines the idle state of the SCK signal.
Drain	To remove entries from a FIFO by software or hardware.
Endianness	Byte Ordering scheme.
Field	Two or more register bits grouped together.
Fill	To add entries to a FIFO by software or hardware.
Host	Refers to another functional block in the device containing the QuadSPI module
Instruction Code	8 bits defining the type of command to be executed.
IP Command	An IP Command is a SFM Command triggered by writing into the QSPI_IPCR[SEQID] field.
Logic level one	The voltage that corresponds to Boolean true (1) state.
Logic level zero	The voltage that corresponds to Boolean false (0) state.
Negated	A signal that is negated is in its inactive state. An active low signal changes from logic level 0 to logic level 1 when negated, and an active high signal changes from logic level 1 to logic level 0.
QSPI_AMBA_BASE	First address of QuadSPI address space on system memory map.
QSPI_ARDB_BASE	First address of QuadSPI Rx Buffer on system memory map.

Table continues on the next page...

Table 43-2. Glossary (continued)

Term	Definition
Set	To set a bit or bits means to establish logic level one on the bit or bits.
RX Buffer PUSH Event	Addition of valid entries into the RX Buffer. In the default case each Buffer PUSH Event adds 2 entries to the RX Buffer since the interface to the serial clock domain is 64 bits in width. Depending on the number of bytes read from the serial flash device it is possible for the very last Buffer PUSH Event that only one entry is added. The QSPI_RBSR[RDBFL] field is incremented by the number of entries added to the RX Buffer.
RX Buffer POP Event	Removal of valid entries from the RX Buffer. Each Buffer POP Event removes (QSPI_RBCT[WMRK] + 1) valid entries from the buffer. The QSPI_RBSR[RDBFL] field is decremented by the same number and the QSPI_RBSR[RDCTR] field is incremented accordingly.
Individual Flash Mode	Access to a single, individual serial flash device. Refer to Serial Flash Access Schemes for details.
Parallel Flash Mode	Read access to two serial flash devices attached to the QuadSPI module in parallel. Refer to Serial Flash Access Schemes for details.
SFM Command	Serial Flash Memory Command. A SFM command consists of an instruction code and all other parameters (for example, size or mode bytes) needed for that specific instruction code. Triggering a command either initiates a transaction on the external serial flash or results in an error. Refer to Table 43-20 for details on errors.
Single/Dual/Quad Instructions	Depending on the serial flash device connected to the QuadSPI module there will be instructions using a different number of data lines. <ul style="list-style-type: none"> • Single: Single line I/O with one data out and one data in line to/from the serial flash device. • Dual: Dual line I/O with two bidirectional I/O lines, driven alternatively by the serial flash device or the QuadSPI module • Quad: Quad line I/O with 4 bidirectional I/O lines, driven alternatively by the serial flash device or the QuadSPI
Transaction	A transaction consists of all flags, data and signals in either direction to execute a command for an attached serial flash device. It is a combination of chip select, sclk, instruction code, address, mode-and/or dummy bytes, transmit and/or receive data.
LUT	Look-up table.

43.2 External Signals

The following table describes the external signals of QSPI:

Table 43-3. QSPI External Signals

Signal	Description	Pad	Mode	Direction
QSPI_A_DATA0	I/O data signal 1 port 0 for serial flash device A	NAND_READY_B	ALT0	I/O
QSPI_A_DATA1	I/O data signal 1 port 1 for serial flash device A	NAND_CE0_B	ALT0	I/O
QSPI_A_DATA2	I/O data signal 1 port 2 for serial flash device A	NAND_CE1_B	ALT0	I/O
QSPI_A_DATA3	I/O data signal 1 port 3 for serial flash device A	NAND_CLE	ALT0	I/O

Table continues on the next page...

**Table 43-3. QSPI External Signals
(continued)**

Signal	Description	Pad	Mode	Direction
QSPI_A_SS0_B	Chip select 1 port 0 for serial flash device A	NAND_DQS	ALT0	O
QSPI_A_SS1_B	Chip select 1 port 1 for serial flash device A	NAND_DATA07	ALT0	O
QSPI_A_DQS	Data strobe signal 1 to serial flash device A	NAND_ALE	ALT0	I
QSPI_A_SCLK	Serial clock output 1 to serial flash device A	NAND_WP_B	ALT0	O
QSPI_B_DATA0	I/O data signal 1 port 0 for serial flash device B	NAND_DATA02	ALT0	I/O
QSPI_B_DATA1	I/O data signal 1 port 1 for serial flash device B	NAND_DATA03	ALT0	I/O
QSPI_B_DATA2	I/O data signal 1 port 2 for serial flash device B	NAND_DATA04	ALT0	I/O
QSPI_B_DATA3	I/O data signal 1 port 3 for serial flash device B	NAND_DATA05	ALT0	I/O
QSPI_B_SS0_B	Chip select 1 port 0 for serial flash device B	NAND_WE_B	ALT0	O
QSPI_B_SS1_B	Chip select 1 port 1 for serial flash device B	NAND_DATA00	ALT0	O
QSPI_B_DQS	Data strobe signal 1 to serial flash device B	NAND_DATA01	ALT0	I
QSPI_B_SCLK	Serial clock output 1 to serial flash device B	NAND_RE_B	ALT0	O

43.2.1 Driving External Signals

The different phases of serial flash access scheme are shown in the following figure.

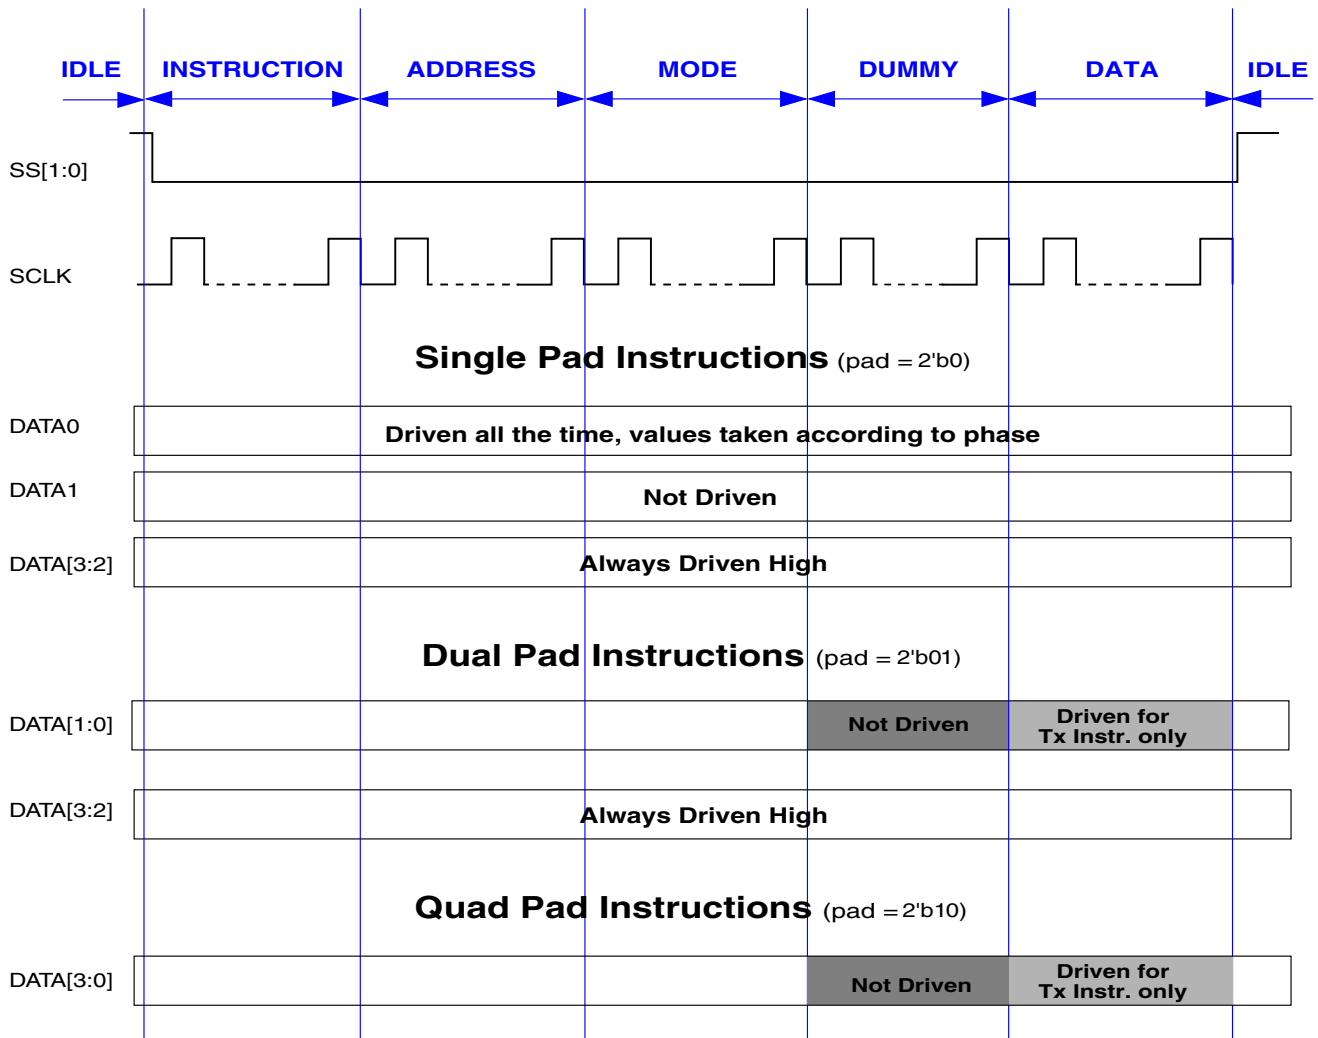

Figure 43-3. Serial Flash Access Scheme

The different phases and the I/O driving characteristics of the QuadSPI module are characterized in the following way:

- **IDLE:** Serial flash device not selected. No interaction with the serial flash device. All DATA signals driven.
- **INSTRUCTION:** Serial flash device selected. The instruction is sent to the serial flash device. All DATA signals are driven.
- **ADDRESS:** Serial Flash Address is sent to the device. All DATA signals are driven. Note that this phase is not applicable for all SFM Commands.
- **MODE:** Mode bytes are sent to the serial flash device. All DATA signals are driven. Note that this phase is not applicable for all SFM Commands.

- **DUMMY:** Dummy clocks are provided to the serial flash device. Refer to the [Figure 43-3](#) for the DATA signals driven. The actual data lines required for the SFM Command executed are not driven for data read commands. Note that this phase is not applicable for all SFM Commands.
- **DATA:** Serial flash data are sent to or received from the serial flash device. Refer to the preceding figure for the DATA signals driven. The actual data lines required for the SFM Command executed are not driven for data read commands. Note that this phase is not applicable for all SFM Commands.

The SS[1:0] and SCLK signals are driven permanently throughout all the phases.

In Individual Flash Mode this applies to the selected flash device. In Parallel Flash Mode this applies to both serial flash devices simultaneously.

43.3 Memory Map and Register Definition

This section provides the memory map and register definitions of the QuadSPI module.

43.3.1 Register Write Access

This section describes the write access restriction terms that apply to all registers, which can be one of the following:

- **Register Write Access Restriction**

For each register bit and register field, the write access conditions are specified in the detailed register description. A description of the write access conditions is given in the following table. If, for a specific register bit or field, none of the given write access conditions is fulfilled, any write attempt to this register bit or field is ignored without any notification. The values of the bits or fields are not changed.

The condition term [A or B] indicates that the register or field can be written to if at least one of the conditions is fulfilled.

Table 43-4. Register Write Access Restrictions

Condition	Description
Anytime	No write access restriction.
Disabled Mode	Write access only if <code>QSPI_MCR[MDIS] = 1</code> .

Table continues on the next page...

**Table 43-4. Register Write Access Restrictions
(continued)**

Condition	Description
Normal Mode	Write access only if the module is in <i>Normal Mode</i> .

• Register Write Access Requirements

All registers can be accessed with 8-bit, 16-bit, and 32-bit wide operations. For some of the registers, at least a 16/32-bit wide write access is required to ensure correct operation. This write access requirement is stated in the detailed register description for each register affected.

43.3.2 Serial Flash Address Assignment

The serial flash address assignment may be modified by writing into [Serial Flash A1 Top Address \(QuadSPI_SFA1AD\)](#) and [Serial Flash A2 Top Address \(QuadSPI_SFA2AD\)](#) for device A and into [Serial Flash B1 Top Address \(QuadSPI_SFB1AD\)](#) and [Serial Flash B2 Top Address \(QuadSPI_SFB2AD\)](#) for device B. The following table shows how different access modes are related to the address specified for the next SFM Command. Note that this address assignment is valid for both IP and AHB commands.

Table 43-5. Serial Flash Address Assignment

Parameter	Function	Access Mode
QSPI_AMBA_BASE (31:10) - 22 bits)	QuadSPI AHB base address	
TOP_ADDR_MEMA1(T PADA1)	Top address for the external flash A1 (first device of the dual die flash A, or the first of the two independent flashes sharing the IOFA)	Any access to the address space between TOP_ADDR_MEMA1 and QSPI_AMBA_BASE will be routed to Serial Flash A1
TOP_ADDR_MEMA2(T PADA2)	Top address for the external flash A2 (second device of the dual die flash A, or the second of the two independent flashes sharing the IOFA).	Any access to the address space between TOP_ADDR_MEMA2 and TOP_ADDR_MEMA1 will be routed to Serial Flash A2
TOP_ADDR_MEMB1(T PADB1)	Top address for the external flash B1 (first device of the dual die flash B, or the first of the two independent flashes sharing the IOFB)	Any access to the address space between TOP_ADDR_MEMB1 and TOP_ADDR_MEMA2 will be routed to Serial Flash B1
TOP_ADDR_MEMB2(T PADB2)	Top address for the external flash B2 (second device of the dual die flash B or the second of the two independent flashes sharing the IOFB)	Any access to the address space between TOP_ADDR_MEMB2 and TOP_ADDR_MEMB1 will be routed to Serial Flash A2

43.3.3 AMBA Bus Register Memory Map

QSPI_AMBA_BASE defines the address to be used as start address of the serial flash device as defined by the system memory map..

Table 43-6. QuadSPI AMBA Bus Memory Map

Address	Register Name
Memory Mapped Serial Flash Data - Individual Flash Mode on Flash A	
QSPI_AMBA_BASE to (TOP_ADDR_MEMA2 - 0x01)	Memory Mapped Serial Flash Data - Individual Flash Mode on Flash A Refer to Memory Mapped Serial Flash Data - Individual Flash Mode on Flash A for details and to Table 43-14 and Table 43-18 for information about the byte ordering.
Memory Mapped Serial Flash Data - Individual Flash Mode on Flash B	
TOP_ADDR_MEMA2 to (TOP_ADDR_MEMB2 - 0x01)	Memory Mapped Serial Flash Data - Individual Flash Mode on Flash B Refer to Memory Mapped Serial Flash Data - Individual Flash Mode on Flash B for details and to Table 43-14 and Table 43-18 for information about the byte ordering.
Parallel Flash Mode	
QSPI_AMBA_BASE to (TOP_ADDR_MEMB2 - 0x01)	Parallel Flash Mode Refer to Parallel Flash Mode for details and to Table 43-17 and Table 43-18 for information about the byte ordering.
AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31)	
QSPI_ARDB_BASE to... (32 * 4 Byte) QSPI_ARDB_BASE + 0x0000_01FF	AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31) Refer to Table 43-14 and Table 43-16 for information about the byte ordering.

Note

Any read access to non-implemented addresses will provide undefined results.

In case single die flash devices, TOP_ADDR_MEMA2 and TOP_ADDR_MEMB2 should be initialized/programmed to TOP_ADDR_MEMA1 and TOP_ADDR_MEMB1 respectively- in effect, setting the size of these devices to 0. This would ensure that the complete memory map is assigned to only one flash device.

Parallel Flash Mode is valid only for commands related to data read from the serial flash. The first device of flash A has to be paired with the first device of flash B and the second device of flash A has to be paired with the second device of flash B in parallel mode. Parallel mode is selected via the QSPI_BFGENCR[PAR_EN] bit for all masters in AHB driven mode and via the QSPI_IPCR[PAR_EN] in IP driven mode. In

parallel mode, the incoming address (SFAR address in case of IP initiated transactions and the incoming AHB address in case of AHB initiated transactions) is divided by 2 and sent to the two flashes connected in parallel.

Any IP Command other than data read in Parallel Flash Mode will result in the assertion of the QSPI_FR[IUEF] flag and any AHB Command other than data read in Parallel Flash Mode will result in the assertion of the QSPI_FR[ABSEF] flag.

In the Individual Flash Modes, the 3/4 address bytes (as programmed in the instruction/operand in the sequence) available for the flash address is determined by SFADR [23:0] or SFADR [31:0] as given in the table above.
